Mandatory warning for CEE countries

**Warning:** This appliance is designed, approved and inspected to meet the requirements of the English market. The identification plate located on the inside of the appliance certifies the origin where the product was manufactured and the country for which it is intended.

If you see any exception to this rule, please contact your nearest **Saunier Duval** dealer.

Thank you in advance for your assistance.
The **ISOFAST F** boiler is a wall mounted modulating combination boiler with electronic ignition providing central heating and instantaneous hot water. The boiler is equipped with a 4 litre domestic hot water storage vessel that ensures maximum hot water temperature stability during domestic demand.

The boiler is of the **I2E+** category for use with Natural Gas (G20) as distributed in the United Kingdom, or Butane (G30), Propane (G31) or Towns Gas (G130) with the appropriate conversion kit.

The boiler has a fan assisted balanced flue which both discharges the products of combustion to and draws the combustion air from the outside of the room. The boiler is suitable for top outlet flue connection only but, can be fitted with horizontal flue, vertical flue or twin-pipe flue. Refer to flue catalogue for further details.

Both the central heating and domestic hot water temperature are user adjustable from the boiler control panel.

Domestic hot water demand always has priority over heating demand.

The boiler is designed for use as part of a sealed water central heating system with fully pumped circulation. The pump, expansion vessel and associated safety devices are all fitted within the boiler.

The boiler can be installed against either an external wall or on an adjacent inside wall, that is, the flue system will pass directly to the rear or to either side to the terminal fitted on the outside wall face.

The installation must be carried out by a competent person in accordance with the relevant requirements of The Building Regulations, The Water Byelaws, The Building Standards (Scotland) Regulations and any applicable local regulations.

These instructions should be carefully followed for the safe and economical use of your boiler.

**Ancillary equipment**

A range of flue accessories are available including vertical flues, twin-pipe flues, bends etc. For further information contact your supplier.

**Substances Hazardous to Health**

The adhesives and sealants used in this appliance are cured and give no known hazard in this state.

**INSULATION PADS/CERAMIC FIBRE, GLASSYARN, MINERAL WOOL**

These can cause irritation to skin, eyes and the respiratory tract. If you have a history skin complaint you may be susceptible to irritation. High dust levels are usual only if the material is broken. Normal handing should not cause discomfort, but follow normal good hygiene and wash your hands before eating, drinking or going to the toilet.

If you do suffer irritation to the eyes or severe irritation to the skin, seek medical attention.

---

**COMMISSIONING**

**Gas safety (Installation and use) Regulations**

In your interests and that of gas safety, it is the law that ALL gas appliances are installed and serviced by a competent person in accordance with the above regulations.

**Gas leak or fault**

If a gas leak or fault exists or is suspected, turn the boiler off and consult the local gas supply company or your installation/servicing company.

**Air in the heating system**

Persistent air in the heating system may indicate leaks in the system or corrosion taking place. Call your Installation/Servicing company.

**Overheating safety**

In the event of a problem, the overheating safety devices cause safety shutdown of the boiler. If this happens, call your Installation/Servicing company.

**Boiler controls**

The control panel, located at the lower front of the boiler casing, see diagram 1, allows the boiler to be started, shut down, controlled and monitored during use.

**Flue**

Do not obstruct the outside terminal of the boiler.

**Diagram 1**

1. On/Off button
2. Summer/Winter mode selector
3. Hot water temperature adjuster
4. Hot water set point display
5. Graphic display
6. Heating temperature adjuster
7. Heating set point display
8. Display backlight
LIGHTING

Make sure that:
- The boiler is connected to the electrical supply.
- The gas service cock is open.
Then follow the instructions below:

1. Press the On/Off button (1)

The pressure must be between 1 and 2 bar. If not, the system must be filled by a competent person.

To stop the boiler: Press button (1)

Setting to the SUMMER position (Hot water only)

2. Press the mode button to select the summer symbol

The flame symbol appears when the boiler is running

Adjusting the hot water temperature

3. Press + or - to adjust the maximum temperature of the hot water (38°C to 60°C)

Visual indication of set temperature

To obtain domestic hot water, open a hot water tap. Hot water always has priority over central heating.

Setting to the WINTER position (Heating + hot water)

4. Press the mode button to select the winter symbol

The actual temperature of the heating system

Illuminates when the boiler lights

Adjusting the heating temperature

5. Press + or - to adjust the maximum temperature of the heating (38°C to 87°C)

Visual indication of set temperature
CLOCK - INSTRUCTIONS FOR USE

The boiler must be connected to the electrical supply and switched on.

Setting the time
Rotate the clock actuator mechanism clockwise, by hand, until the current time is indicated by the arrow, see diagram 2.

Note: The time is set in 24 hour format, for example, 1300 for 1pm.

Setting the programme "On" and "Off" times
- Select the "On" times by pushing the white tappets to the outside, see diagram 2.
- Select the "Off" times by pushing the white tappets to the inside, see diagram 2.

The clock shown in diagram 2 is set as follows:
ON ➔ 07.00am to 09.00am (7-9)
OFF ➔ 09.00am to 04.00pm (9-16)
ON ➔ 04.00pm to 10.00pm (16-22)
OFF ➔ 10.00pm to 07.00am (22-7)

To override or advance the clock
The clock has a manual On/Off switch, see diagram 3, which operates as follows:
Upper position
Heating On/Off as set by the tappets.
Middle position
Heating Off continuously
Lower position
Heating On continuously

DRAINING

Protection against freezing
If the boiler is to be out of use for any long periods during severe weather conditions, it is recommended that the whole system, including the boiler, be drained to avoid the risk of freezing.

The ISOFAST has a built-in frost protection device that protects the boiler from freezing. If the boiler is to be left and there is a risk of frost, ensure that the gas and electrical supplies are left connected. The frost protection device will light the boiler when the temperature of the boiler water falls below 6°C. When the temperature reaches 16°C, the boiler stops.

Note: This device works irrespective of any room thermostat setting and will protect the complete heating system.

Draining and filling
Caution: The boiler is installed as part of a sealed system which must only be drained and filled by a competent person.

Heating safety valve
CAUTION: A heating safety valve with a discharge pipe is fitted to this boiler. The valve MUST NOT BE TOUCHED except by a competent person. If the valve discharges at any time, switch the boiler off and isolate it from the electrical supply. Contact your installation/service company.

Pressure relief valve
CAUTION: A domestic hot water pressure relief valve, with a discharge pipe, is fitted to this boiler. The valve MUST NOT BE TOUCHED except by a competent person. If the valve discharges at any time, switch the boiler off and isolate it from the electrical supply. Contact your installation/service company.

SERVICING/MAINTENANCE

To ensure the continued efficient and safe operation of the boiler, it is recommended that it is checked and serviced at regular intervals.

The frequency of servicing will depend upon the installation conditions and usage but, in general, once a year should be enough.

Cleaning
The boiler casing can be cleaned with a damp cloth followed by a dry cloth to polish.
Do not use abrasive or solvent cleaners.

Boiler casing
CAUTION: Do not remove or adjust the casing in any way, as incorrect fitting may result in faulty operation. If in doubt, consult your installation/service company.

**HEATING SYSTEM DESIGN**

- The **ISOFAST** is compatible with any type of installation.
- Heating surfaces may consist of radiators, convectors or fan assisted convectors.
- The **ISOFAST** can be piped directly to an underfloor heating system without the need for a mixing bottle. The maximum central heating flow temperature can be set to 53°C on the boiler printed circuit board during commissioning.
- Pipe sectional areas shall be determined in accordance with normal practices, using the output/pressure curve (**diagram 4**). The distribution system shall be calculated in accordance with the output requirements of the actual system, not the maximum output of the boiler. However, provision shall be made to ensure sufficient flow so that the temperature difference between the flow and return pipes be less than or equal to 20°C. The minimum flow is 400 l/h.
- The piping system shall be routed so as to avoid any air pockets and facilitate permanent venting of the installation. Bleed fittings must be provided at every high point of the system and on all radiators.

- The total volume of water permitted for the heating system depends, amongst other things, on the static head in the cold condition. The expansion vessel on the boiler is pressurised at 0.5 bar (corresponding to a static head of 5 m w.g.) and allows a maximum system volume of 160 litres for an average temperature of 75°C and a maximum service pressure of 3 bar. This pressure setting can be modified at commissioning stage if the static head differs. An additional expansion vessel can be fitted to the system if required, see **diagram 8**.
- Provision shall be made for a drain valve at the lowest point of the system.
- Where thermostatic radiator valves are fitted, not all radiators must be fitted with this type of valve, and in particular, where the room thermostat is installed.
- In the case of an existing installation, it is ESSENTIAL that the system is thoroughly flushed prior to installing the new boiler.

**Filling the system**
The **ISOFAST** is supplied with a built-in filling device, see **diagram 7**.
DOMESTIC HOT WATER SYSTEM DESIGN

- Copper tubing or plastic Hep 20 may be used for the domestic hot water system. Unnecessary pressure losses should be avoided.
- A flow restrictor limiting the flow through the boiler to a maximum of 16 l/min is fitted to the boiler.
- The boiler will operate with a minimum supply pressure of 0.7 bar, but under reduced flow rate. Best operating comfort will be obtained from a supply pressure of 1 bar.

'Hard Water Areas'

In areas where the water is 'hard', more than 200mg/litre, it is recommended that a proprietary scale reducer is fitted in the cold water supply to the boiler.

**FIXING JIG**

The fixing jig is made up, from left to right, as follows:

- **A** - Heating return fitting with isolating valve (v) and drain knob (u).
- **B** - Cold water inlet fitting with isolating valve (m) and factory fitted flow regulator and filter (not shown).
- **C** - Heating flow fitting with isolating valve (q), drain knob (r) and safety valve (s1).
- **D** - Domestic hot water outlet fitting with safety valve (s2).
- **F** - Gas fitting.
- **G** - Filling device.

---

**PIPING SYSTEM INSTALLATION**

- Heating system connections - Pipe diam. 22mm
- Hot water system connections - Pipe diam. 15mm
- Gas connection - Pipe diam. 22mm
- Domestic safety valve connection - Pipe diam. 15mm
- Heating safety valve connection - Pipe diam. 15mm

**Water connection**

Connect the copper connections supplied, to the fixing jig fittings, see diagram 7. Connect the system pipework to the boiler observing the correct flow and return format as shown in diagram 8.

**Safety valve discharge**

Tee the domestic safety valve outlet pipe to the heating safety valve outlet pipe and extend horizontally to the outside wall.

WARNING. It must not discharge above an entrance or window or any type of public access area.

Connect the safety valve discharge pipe to the outlets of both the heating safety valve and the hot water safety valve, the discharge must be extended using not less than 15 m o.d. pipe, to discharge in a visible position outside the building, facing downward preferably over a drain.

The pipe must have a continuous fall and be routed to a position so that any discharge of water, possibly boiling or steam, cannot create any danger to persons, damage to property or external electrical components and wiring. Tighten all pipe connection joints.

**Gas connection**

- The supply from the governed gas meter must be of adequate size to provide a constant inlet working pressure of 20 mbar (8 in w.g.).
- To avoid low gas pressure problems, it is recommended that the gas supply is connected using 22 mm pipe.
- On completion, the gas installation must be tested using the pressure drop method and purged in accordance with the current issue of BS6891.

**Gas Safety (Installation and use) Regulations**

In your interests and that of gas safety, it is the law that ALL gas appliances are installed and serviced by a competent person in accordance with the above regulations.

---

**Diagram 7**

**Diagram 8**
Clearances
The position of the boiler must be such that there is adequate space for servicing.
The recommended clearances are:
20 mm either side of the boiler.
600 mm at the front of the boiler.
300 mm below the boiler.

- Place template on wall in required position, making allowances for the necessary clearances etc.
- Note: It is permissible to install the boiler with smaller clearances than those quoted above PROVIDING that adequate consideration is given for Servicing/Repairs at a later date. If any doubt exists, contact the Saunier Duval Technical Helpline 01773 828400.

- Mark the position of the holes for the hanging bracket.
- Drill, plug and fix the hanging bracket to the wall using suitable screws.
- Check that the hanging bracket is level.
- For horizontal flue system, mark the position for the flue hole as follows:

Flue to rear of boiler
- Mark correct position of hole from template.

Flue to side of boiler
- Mark the horizontal centre line for the hole on the rear wall. Extend the horizontal centre line to the side wall and mark the vertical centre line of flue hole as shown in diagram 9.

Cutting the flue hole
- Making allowance for the slope of the flue, cut hole in external wall, preferably using a core drill.
  For installations with internal and external access use a 10.5 mm diameter core drill.
  For installations with internal access only use a 125 mm diameter core drill.

Important
When cutting the flue hole and when extending the flue centre line to a side wall, remember that the flue system must have a fall of about 35 mm per metre of flue DOWNWARD towards the terminal. There must NEVER be a downward incline towards the boiler.

Terminal position
The minimum acceptable spacings from the terminal to obstructions and ventilation openings are shown in diagram 10.
The boiler must be installed so that the terminal is exposed to the external air.
Should any doubt exist as to the permissible position of the terminal, contact the Saunier Duval Technical Helpline 01773 828400.

Terminal guard
If a terminal guard is required, a suitable guard can be obtained from your supplier, Saunier Duval part number 85373.

Cupboard or compartment ventilation
The boiler can be fitted in a cupboard or compartment without the need for permanent ventilation.

BOILER INSTALLATION

Statutory requirements
The installation of this boiler must be carried out by a competent person in accordance with the relevant requirements of the current issue of:
The Gas Safety (Installation and Use) Regulations
The Building Regulations
The local water company Byelaws
The Building Standards Regulations (Scotland)
The Health and Safety at Work Act

Sheet metal parts
WARNING: When installing or servicing this boiler, care should be taken when handling the edges of sheet metal parts to avoid the possibility of personal injury.

Installing the boiler
Prior to starting work, the system must be thoroughly flushed using a propriety cleanser such as Sentinel X300 to eliminate any foreign matter and contamination e.g. metal filings, solder particles, oil, grease etc.

Note: Solvent products could cause damage to the system.

● Engage boiler upper part onto the hanging bracket.
● Fit the washers between the boiler pipes and the inlet and outlet fittings on the fixing jig and connect the various couplings between the boiler and jig.

FLUE INSTALLATION

Top outlet flue - kit 85090
The boiler is only suitable for top outlet flue connection.

Calculation of flue cutting lengths
● Measure wall thickness e (mm), see diagram 11.
● For side flues, measure distance from inside face of side wall to centre line of boiler and subtract 235 to get dimension a (mm).
● Refer to table 2 for cutting lengths of both inner and outer flue pipes for each of the various flue options available.

Important: All flue cutting lengths must be measured from the terminal end of the flue pipes, see diagram 12.

When the dimension X measured on site is greater than that given in table 2, a flue extension kit will be required, refer to table 3 for details.

Extended flue
The horizontal flue is extended by using one or more of the 1000 mm extension pipes, Saunier Duval part number 85091. These are connected together by push fit type joints, clamps and seals.

Calculation of flue cutting lengths for extended flue
● Using the correct number of extension kits as table 3, measure dimensions a and e, see diagram 12. Cut both the inner and outer pipes to the dimensions given in table 4

Important: All cutting lengths should be measured from the push fit joint end of the extension pipe. Do not leave any burrs or sharp edges on the cut ends of the pipes.

</tbody>
</table>

**Installation of flue assembly**
- Fit rubber sealing collar (A), see diagram 13, into groove at the outer end of pipe (B).
- Fit outer pipe (B) into wall with groove to the outside.
- Pull pipe inwards to bring rubber sealing collar hard up against external wall, see diagram 14.
- Fit internal plastic flange (C) onto outer pipe. Push along the pipe until engaged against internal wall.
- From inside, insert inner pipe (D) into outer pipe.
- Fit both ‘O’ rings (E) into the flue elbow (F), one at the inlet, one at the outlet. By necessity, they are a loose fit, apply a small amount of silicone grease to each ‘O’ ring when fitting.
- Slacken the two screws and fit the clamp and seal (G) onto the elbow.
- Take hold of the inner flue and push gently onto the elbow outlet taking care not to tear the ‘O’ ring.
- Important: If the flue has been cut, ensure that there are no burrs that could damage the ‘O’ ring.
- Push the elbow clamp and seal over the outer flue.
- For flue systems less than 1,5 m long, leave the restrictor (a) fitted in the fan outlet, see diagram 15.

**Concentric flue system**

The maximum permissible length (L) for the concentric flue system is 3,5 m (F 28 E) or 2 m (F 35 E). For flue systems up to 1,5 m length, the restrictor (a) supplied fitted to the boiler, inside the fan outlet, must be left in place. For longer flue systems, the restrictor must be removed.

For each 90° flue elbow used, (or two 45° elbows) the maximum permissible length (L) must be reduced by 1 metre.

- Remove the backing from the self adhesive gasket (H) and carefully fit gasket to base of flue elbow.
- Fit elbow onto boiler and secure with the four screws (I).
**Warning.** This boiler must be earthed.
All system components must be of an approved type.

Connection of the whole electrical system and any heating system controls to the electrical supply must be through a common isolator.
Isolation should preferably be by a double pole switched fused spur box having a minimum contact separation of 3 mm on each pole. The fused spur box should be readily accessible and preferably adjacent to the boiler. It should be identified as to its use.
A fused three pin plug and shuttered socket outlet may be used instead of a fused spur box provided that:
- **a)** They are not used in a room containing a fixed bath or shower.
- **b)** Both the plug and socket comply with the current issue of BS1363.
The mains electrical supply must be maintained at all times in order to provide domestic hot water. Do not interrupt the mains supply with a time switch or programmer.

**WARNING: ON NO ACCOUNT MUST ANY EXTERNAL VOLTAGE BE APPLIED TO ANY OF THE TERMINALS ON THE HEATING CONTROLS CONNECTION PLUG.**

**Warning:** This appliance must be wired in accordance with these instructions. Any fault arising from incorrect wiring cannot be put right under the terms of the *Saunier Duval* guarantee.

**External controls**
The ISOFAST boiler is designed to operate at maximum efficiency at all times, but will be most efficient and economical when connected to a room thermostat.
A suitable room thermostat is available as an accessory, *Saunier Duval* part number 40011. Please contact your supplier.

The boiler will work for heating without a room thermostat being connected provided that the wire link fitted between the two terminals of the connector (E) is left in place, see diagram 17.
Alternatively, a 230V room thermostat can be used but do not make any connection to the compensating resistor, see diagram 17.
**ON NO ACCOUNT** must any electrical voltage be applied to any of the terminals of the external controls plug.

**Note:** For further information, see the building regulations 1991 - Conservation of Fuel and Power - 1995 edition - appendix G, Table 4b.
The commissioning and first firing of the boiler must only be done by a competent person.

**Gas installation**

It is recommended that any air is purged from the supply at the gas inlet test point on the gas valve, see diagram 18.

**Filling the system**

1. Press the mains 'On/Off' button

   The display will indicate 0 bar pressure in the system
   The warning light will illuminate

2. Open the boiler isolating valves (v and q), the slot of the screw corresponds to flow direction.
   Fully open valve m by unscrewing anti-clockwise.

3. Undo cap on automatic air vent on top of pump and leave undone.

4. Open the tap (t) on the filling device and fill the system until the pressure indicated on the display is between 1 and 2 bar.

   The pressure must be between 1 and 2 bar
5 Bleed each radiator to remove the air, re-tighten bleed screws.

6 Leave the cap on the pump auto air vent open.

7 Open various hot water taps to bleed system.

8 Make sure the display indicates a system pressure of between 1 and 2 bar. Re-fill system as necessary.

The pressure must be between 1 and 2 bar
**Commissioning**

**Lighting the boiler:**

- Make sure that:
  - The boiler is connected to the electrical supply.
  - The gas service cock is open.

Then follow the instructions below:

1. Press the On/Off button (1)

   - The pressure must be between 1 and 2 bar. If not, the system must be filled by a competent person.

2. Set to the WINTER position (Heating + hot water)

   - Press the mode button to select the winter symbol

   - The actual temperature of the heating system illuminates when the boiler lights

3. Adjust the heating temperature

   - Press + or - to adjust the maximum temperature of the heating (38°C to 87°C)

   - Adjust heating temperature to maximum.
   - Check that any external controls, if fitted, are calling for heat (set room thermostat to maximum).
   - Allow the temperature to rise to the maximum value, with all radiator valves open. The temperature rise will cause release of the gases contained in the water of the central heating system.
   - Gases driven towards the boiler will be automatically released through the automatic air vent.
   - The gases trapped at the highest point of the system must be released by bleeding the radiators. On reaching maximum temperature, the boiler should be turned off and the system drained as rapidly as possible whilst still hot.
   - Refill system to a pressure of between 1 and 2 bar and vent as before.
   - Restart boiler and operate until a maximum temperature is reached. Shut down boiler and vent heating system. If necessary, top up heating system and make sure that a pressure of 1 bar is indicated when system is COLD.

**To stop the boiler:**

Press button (1)
COMMISSIONING

Setting the heating output
The heating output can be set without the use of a
pressure gauge; proceed as follows:
- Press the display light button
  and keep pressed for 5 seconds, see diagram 20.
  Note: The boiler has now been put into ‘Service
  Mode’, allowing certain adjustments to be made
  and diagnostic fault codes to be displayed. Refer
  to the “Servicing Instructions” for further details.
The heating output, in kW, is shown on the left
hand side of the display, see diagram 21.
- Remove the blanking plug from the front of
  the control panel to gain access to the heating
  adjusting screw.
- Adjust the heating output by turning the screw
  clockwise to increase, anti-clockwise to decrease.
- Refit blanking plug.
  Note: Adjustment of the heating output does not
  affect the domestic hot water output.

For kW to Btu/hr conversion refer to table 5.

Table 5

</tbody>
</table>

Setting the maximum heating temperature
The maximum heating temperature can be preset
at commissioning stage to suit the type of heating
system. For example, for use with underfloor heating,
the maximum heating temperature can be set to 53°C.
To adjust the maximum temperature, proceed as
follows:
- Remove the blanking plug (b) from the rear of
  the control panel to gain access to selector switch
  SW1 (see diagram 22).
  Adjust toggles 1 and 2 to give the desired maxi-
  mum heating temperature, see diagram
  Note: To adjust the maximum heating temperature
  it is only necessary to change toggles 1 and 2. Do
  NOT touch any other toggles.
- Refit blanking plug.

SAFETY DEVICES

The ISOFAST incorporates a visual display that indi-
cates fault conditions, should they occur.
In the event of a fault, the display will indicate, by
means of pictograms and/or letters and numbers,
exactly in which area the fault lies.

Should the boiler fail to operate during Commis-
sioning, the most likely fault is that the gas supply
to the boiler has not been turned on or purged suf-

ciently or that there is no pressure in the heating
system. These are indicated as follows:
SAFETY DEVICES

No gas supply

This will be indicated on the display as a pictogram of a spark.

To rectify this, proceed as follows:

- Switch off the boiler at the On/Off push button.
- Rectify the gas supply problem.
- Restart the boiler by pressing the On/Off button.

Insufficient system pressure

This will be indicated on the display as a flashing warning indicating the system pressure is low.

To rectify this the system must be re-filled, refer to 'Commissioning'.

Other faults

These are indicated on the display by a fault code and a telephone symbol. Further information on the fault codes can be found in the 'Servicing Instructions'.

General safety devices

Air flow rate safety device
If an obstruction, even partial, of the flue occurs, for any reason whatsoever, the built in safety system of the boiler will turn the boiler OFF and the fan will continue to run. The boiler will be ready to operate when the fault has been cleared.

Overheat safety
In case of boiler overheating, the overheat thermostat will turn the boiler off. The thermostat, located on the heat exchanger flow pipe, will need to be manually reset.

In case of power supply failure
The boiler no longer operates. As soon as power supply is restored, the boiler will be automatically restarted.

Frost protection
The ISOFAST has a built in frost protection device that protects the boiler from freezing. If the boiler is to be left and there is a risk of frost, ensure that the gas and electrical supplies are left connected. The frost protection device will light the boiler when the temperature of the boiler water falls below 6°C. When the temperature reaches 16°C, the boiler stops.

Note: This device works irrespective of any room thermostat setting and will protect the complete heating system.
 SETTINGS

Gas valve setting
All boilers are tested and factory set during manufacture. Should it be necessary to reset a gas valve, for example, after replacement, proceed as follows:
- Shut down boiler.

Minimum setting
- Remove one electrical connector from the modulating gas valve coil, see diagram 23.
- Connect a suitable pressure gauge.
- Turn the OFF/Summer/Winter switch to the ‘Summer’ position.
- Turn the domestic hot water temperature adjuster to maximum setting.
- Remove the protective cover from the gas valve adjuster.
- Turn nut ‘A’, see diagram 23:
  CLOCKWISE: To increase the pressure.
  ANTICLOCKWISE: To decrease the pressure.

Maximum setting
- Reconnect the electrical connector removed from the modulating gas valve coil.
- Remove the protective cover from the gas valve adjuster.
- Turn nut ‘B’, see diagram 23:
  CLOCKWISE: To increase the pressure.
  ANTICLOCKWISE: To decrease the pressure.
- After adjustment, refit the cover to the gas valve adjuster.

Bypass
The ISOFAST has a built-in bypass. This must be adjusted according to the requirements of the system, refer to the flow rate pressure curve (diagram 4). The boiler is supplied with the built-in bypass open a half a turn. It is adjusted by turning the bypass screw (a), see diagram 24. Turn the screw clockwise to close the bypass. When using thermostatic radiator valves (TRV’s) on all of the radiators, it is essential that a separate, adjustable bypass of 15 mm minimum diameter is fitted between the flow and return of the heating circuit, see diagram 8. Any bypass must be fitted before system controls.
ROUTINE CLEANING AND INSPECTION

To ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the particular installation conditions and usage, but in general once a year should be enough.

It is the law that any servicing is carried out by a competent person.

Service Check and Preparation.
- Operate boiler and check for any faults that need to be put right.
- Isolate boiler from the gas and electrical supplies.
- On completion check all gas carrying parts for soundness with leak detection fluid.
- Remove boiler casing as follows:

Upper front panel
- Remove the two front panel retaining brackets from the top of the boiler.
- Remove panel by lifting up and forward.

Sealed chamber cover
- Unclip two toggle clips holding the sealed chamber cover, see diagram 1.
- Lift cover up and off boiler.

Front control panel
- Lift control panel up and lower forwards to gain access to lower part of boiler.

Side panels
- Unscrew and remove the four screws securing lower grille onto boiler. Unhook grille from rear of boiler and remove.
- Remove three screws from front of each side panel.
- Unclip the toggle clips securing top of each panel. Lift each panel up and then forward to remove.

Combustion chamber cover
- Unclip two toggle clips and unscrew two screws securing combustion chamber cover to combustion chamber, see diagram 2.
- Remove combustion chamber cover from boiler.
- Undo, but do not remove, two burner support screws at rear of burner chamber.

Burner
- Undo main gas supply nut from burner.
- Pull off the ignition and flame sense leads from the gas valve remove burner from boiler by lifting up and pulling forwards from keyhole slots.

**Note:** The washer between main burner and main burner gas supply must be kept for use on reassembly.
- Remove ignition and flame sense electrodes from burner.
- Unscrew and remove injector bar retaining screws and separate injector bar from burner.
- Examine and clean injectors as necessary.

**Note:** DO NOT use a wire or sharp instrument on the holes.
Clean burner by washing in soapy water. Dry thoroughly before re-fitting.

Heat exchanger
- Disconnect power supply leads and earth lead from fan.
- Unscrew and remove, two fan retaining screws at front edge of fan mounting plate.
- Remove fan with mounting plate attached by pulling forwards out of boiler.
- Remove air pressure switch sensing tube from sensing probe on flue hood.
- Unscrew and remove screws securing flue hood to rear panel.
- Withdraw flue hood from boiler.
- Examine heat exchanger for any blockages or build up of deposits.
- Clean heat exchanger with soft brush or vacuum cleaner. Do not use any tool likely to damage painted finish of heat exchanger.

Reassembly of parts removed for servicing
All parts are replaced in reverse order to removal.
ROUTINE CLEANING AND INSPECTION

Flue system
• Check externally to make sure that flue is not blocked
• Inspect flue system to make sure that all fittings are secure.

Operation of fan
• Switch on electrical supply and turn on gas.
• Light burner by opening a hot water tap.
• Without sealed chamber cover in place, burner should be automatically prevented from lighting by air flow detection system.
• Refit sealed chamber cover.
• Check that fan operates when burner lights and stops when it goes out.

Note: These valves are closed when slots are at right angles to direction of flow.

Cold water inlet filter
Drain down hot water circuit of boiler only, as follows:
• Close isolating valve/throttle \( (m) \) on cold water isolating cock, see diagram 3. 
Note: This valve is closed when screwed fully clockwise.
• Open one or more hot water taps to drain boiler circuit.
• Undo connecting nut from cold water inlet connection.
• Clean and inspect filter, replace if necessary.
• With both filter and restrictor in place, reconnect connecting pipe to inlet connection and tighten.
• Fully open isolating valve/throttle on cold water inlet and check for leaks.

REPLACEMENT OF PARTS

For replacement of the following components it will be necessary to remove boiler casing panels as described in ‘Routine Cleaning and Inspection’.

WARNING: Before commencing the replacement of any component, isolate appliance from electrical supply and turn off gas at service cock.

To replace domestic hot water thermistor
• Locate domestic hot water thermistor on hot water flow pipe on right hand side of boiler adjacent to gas valve.
• Unclip thermistor from pipe.
• Disconnect leads from thermistor.
• Fit replacement thermistor.
• Fit leads to replacement thermistor, the polarity is not important.

To replace central heating thermistor
• Locate central heating thermistor on heating flow pipe on centre of boiler.
• Unclip thermistor from pipe.
• Disconnect leads from thermistor.
• Fit replacement thermistor.
• Fit leads to replacement thermistor, the polarity is not important.

To replace storage vessel thermistor
For this operation the boiler must be removed from the wall.
• Drain down heating and hot water circuit of the boiler only, as follows:
• Close isolating valves \( (q) \) and \( (v) \) on central heating isolating cocks \( (a) \) and \( (c) \), see diagram 3.

Note: These valves are closed when slots are at right angles to direction of flow.
• Drain boiler by opening drain valves \( (r) \) and \( (u) \), see diagram 3.

Note: It is not necessary to drain down entire heating system to carry out this work.
• Close isolating valve/throttle \( (m) \) on cold water isolating cock, see diagram 3.
Note: This valve is closed when screwed fully clockwise.
• Open one or more hot water taps to drain boiler circuit.
• Disconnect flue system.
• Disconnect boiler pipes onto fixing jig.
• Disconnect mains cable and any external controls cables.
• Remove boiler from wall.
• From rear of boiler, disconnect domestic pipes from storage vessel.
• Disconnect electrical connections from vessel.
• Unclip vessel from boiler frame and remove from boiler.
• Slide off plastic strap and separate two halves of vessel insulation.
• Locate thermistor at top of insulation.
• Replace thermistor in same position as old thermistor.
• Refit vessel in reverse order to removal.
• Refit boiler onto fixing jig, tighten all connections ensuring that all sealing washers are fitted before tightening.
• Reconnect flue making sure that all joints are properly connected.
REPLACEMENT OF PARTS

- Open isolating valves on flow and return connections, refill, vent and pressurise boiler.
- Check for leaks.
- Reconnect all electrical connections and restore electrical supply.
- Open gas cock, operate boiler and re-check all joints for soundness.

To replace fan
- Remove fan as described in ‘Routine Cleaning and Inspection’.
- Fit replacement fan in reverse order to removal.
- Reconnect electrical leads.

To replace air pressure switch
- Locate air pressure switch situated inside sealed chamber on top right hand side.
- Remove air pressure switch tube from sensing probe on flue hood.
- Disconnect air pressure switch electrical connections.
- Undo screws on top of boiler securing air pressure switch to boiler and remove switch.
- Pull sensing tube off switch.
- Fit replacement switch to boiler in reverse order to removal, noting that pressure sensing tube fits to left hand connection on switch.

To replace domestic water flow sensor
- Drain down hot water circuit of boiler only as described previously.
- Undo connecting nut from cold water inlet connection.
- Locate flow sensor on cold water inlet pipe to boiler inside controls area, see diagram 4.
- Carefully pull off electrical connector from flow sensor.
- Pull out slotted metal clip securing cold water inlet pipe to flow sensor and carefully remove from sensor.
- Pull out slotted metal clip securing flow sensor to pump mounting and carefully remove sensor from boiler.
- Fit replacement sensor to boiler in reverse order to removal.

To replace printed circuit board (PCB)
- Gain access to rear of control panel.
- Unclip and remove external controls/mains connection access cover.
- Unclip side clips and hinge up control panel cover to gain access to PCB, see diagram 5.
- Carefully pull off electrical connections to PCB.
- Unclip and lift out PCB.
- Fit replacement PCB in reverse order to removal.

Note: 1) Make sure that PCB connections are fully pushed onto replacement PCB.

2) Set the heating temperature option to the same value as the old PCB, refer to ‘Installation and User’ instructions.

To replace fan
- Remove fan as described in ‘Routine Cleaning and Inspection’.
- Fit replacement fan in reverse order to removal.
- Reconnect electrical leads.

To replace air pressure switch
- Locate air pressure switch situated inside sealed chamber on top right hand side.
- Remove air pressure switch tube from sensing probe on flue hood.
- Disconnect air pressure switch electrical connections.
- Undo screws on top of boiler securing air pressure switch to boiler and remove switch.
- Pull sensing tube off switch.
- Fit replacement switch to boiler in reverse order to removal, noting that pressure sensing tube fits to left hand connection on switch.

To replace domestic water flow sensor
- Drain down hot water circuit of boiler only as described previously.
- Undo connecting nut from cold water inlet connection.
- Locate flow sensor on cold water inlet pipe to boiler inside controls area, see diagram 4.
- Carefully pull off electrical connector from flow sensor.
- Pull out slotted metal clip securing cold water inlet pipe to flow sensor and carefully remove from sensor.
- Pull out slotted metal clip securing flow sensor to pump mounting and carefully remove sensor from boiler.
- Fit replacement sensor to boiler in reverse order to removal.
To replace pump
- Drain down heating circuit of the boiler only, as described previously.
  **Note:** It is not necessary to drain down entire heating system to carry out this work.
- Undo two fixing screws and remove pump retaining bracket from front of pump.
- Undo clips securing pump outlet hose connection to pump.
- Slide hose along pipe to clear pump outlet.
- Disconnect pump electrical connection from PCB.
- Transfer automatic air vent to replacement pump using new washers supplied.
- Re-connect electrical connection to PCB.
- Fit replacement pump in reverse order to removal.
- Open isolating valves on flow and return connections, refill, vent and pressurise boiler.
- Check for leaks.

To replace domestic hot water heat exchanger
- Drain down heating and hot water circuits of boiler only as described previously.
  **Note:** It is not necessary to drain down entire heating system to carry out this work.
- Unscrew and remove cold water inlet pipe from fixing jig to water flow sensor.
- Supporting domestic heat exchanger, unscrew and remove two screws securing it onto pump mounting and 3-way valve/bypass housing.
- Remove heat exchanger from boiler.
- Fit replacement heat exchanger in reverse order to removal using new seals, supplied.
  **Note:** Heat exchanger mounting screws are offset to ensure correct fitting of replacement.

To replace 3-way valve head
- Locate 3-way valve in centre of lower controls area.
- Remove electrical plug from valve head.
- Pull out slotted metal clip from valve body and remove valve head from body.
- Fit replacement valve head in reverse order to removal.
  **Note:**
1) When refitting clip, ensure that letters OK are as shown in diagram 6.
2) It is not necessary to drain boiler to carry out this work.

To replace 3-way valve/bypass housing
- Drain down heating and hot water circuit of boiler only as described previously.
  **Note:** It is not necessary to drain down entire heating system to carry out this work.
- Remove 3-way valve head as described previously.
- Remove domestic hot water heat exchanger as described previously.
- Undo pipe connection from 3-way valve/bypass housing to primary heat exchanger, see diagram 7.
- Pull out slotted metal clips and remove bypass pipe.
- Pull out slotted metal clip and remove domestic pipe from 3-way valve/bypass housing to storage vessel.
- Undo pipe from 3-way valve/bypass housing to fixing jig.
- From underneath boiler, undo two screws securing 3-way valve/bypass housing and lift out of boiler.
- Fit replacement 3-way valve/bypass housing in reverse order to removal.

To replace system pressure sensor
- Drain down heating circuit of boiler only as described previously.
  **Note:** It is not necessary to drain down entire heating system to carry out this work.
- Locate system pressure sensor at front left hand side of boiler, see diagram 8.
- Remove electrical connections from sensor.
- Pull off slotted metal clip and remove sensor from boiler.
- Fit replacement sensor in reverse order to removal.

To replace gas valve module
- Locate gas valve module attached to side of gas valve.
REPLACEMENT OF PARTS

• Remove screw securing cover onto gas valve module, see diagram 9.
• Remove cover and disconnect multi-plug from module.
• Disconnect ignition and flame sense leads from module.
• Withdraw module from gas valve.
• Fit replacement module, ensuring it is of the correct type for the boiler, in reverse order to removal.
• Reconnect ignition and flame sense leads, the connections are uniquely sized to ensure correct replacement.
• Reconnect multi-plug onto replacement module.
• Refit cover ensuring all sealing grommets are correctly located in module body.

To replace gas valve
• Ensure that gas supply to boiler is turned off at gas cock.
• Remove gas valve module as described previously.
• Disconnect electrical connections to gas valve modulating coil, see diagram 9.
• Undo main gas supply nut from main burner.
Note: The washer must be kept for use on reassembly.
• Undo main gas union nut between gas valve supply pipe and gas inlet valve.
Note: The washer must be kept for use on reassembly.
• Disconnect plastic sensing pipe from gas valve to base of sealed chamber.
• Unscrew and remove screws securing gas valve bracket to boiler frame.
• Withdraw gas valve assembly.
• Using old gas valve as a guide, transfer gas pipes from old gas valve to replacement gas valve.
• Fit replacement gas valve into boiler.
• Reconnect gas pipes in reverse order to removal.
• Refit electrical connections in reverse order to removal, the polarity of the wires to the modulating coil is not important.

To replace modulating coil
• Ensure that gas supply to boiler is turned off at gas cock.
• Disconnect electrical connections to gas valve modulating coil, see diagram 9.
• Undo two screws securing modulating coil to gas valve and remove coil.

• Fit replacement coil in reverse order to removal.
• Refit electrical connections in reverse order to removal, the polarity of the wires to the modulating coil is not important.

To replace central heating safety valve
If safety valve seating is damaged, it will be necessary to replace safety valve as a complete unit, repair is not possible.
• Drain down heating circuit of boiler only as described previously.
• Disconnect safety valve discharge pipe from safety valve.
• Remove wire clip securing safety valve to fixing jig and remove safety valve, see diagram 10.
• Fit replacement safety valve in reverse order to removal.

Note: Apply a small quantity of silicon grease to the safety valve 'O' ring prior to fitting.
• Open isolating valves on flow and return connections, refill, vent and pressurise boiler.
• Check for leaks.

To replace storage vessel safety valve
If safety valve seating is damaged, it will be necessary to replace safety valve as a complete unit, repair is not possible.
• Drain down hot water circuit of boiler only as described previously.
• Disconnect safety valve discharge pipe from safety valve.
• Remove wire clip securing safety valve to fixing jig and remove safety valve, see diagram 10.
• Fit replacement safety valve in reverse order to removal.
Note: Apply a small quantity of silicon grease to the safety valve 'O' ring prior to fitting.

• Open isolating valve on cold water inlet connection.
• Check for leaks.

To replace heat exchanger
• Drain down heating circuit of boiler only as described previously.
Note: It is not necessary to drain down entire heating system to carry out this work.
• Remove combustion chamber cover, as described in 'Routine Cleaning and Inspection'.
• Disconnect electrical connector from high limit thermostat.
REPLACEMENT OF PARTS

• Remove slotted metal clips from heat exchanger connection pipes.
• Undo nut securing pipe from heat exchanger to 3-way valve/bypass housing.
• Swing pipe away from 3-way valve/bypass housing and pull down to disengage from heat exchanger pipe.
• Pull down pipe from pump to heat exchanger to disengage from heat exchanger pipe.
• Slide heat exchanger forwards and remove from boiler. See diagram 11.
• Fit replacement heat exchanger in reverse order to removal.
• Reconnect electrical connector to high limit thermostat.
• Open isolating valves on flow and return connections, refill, vent and pressurise boiler.
• Check for leaks.

To replace combustion chamber insulation
• Remove combustion chamber cover as described in ‘Routine Cleaning and Inspection’.
• Remove heat exchanger as described previously.
• Remove fan and flue hood as described in ‘Routine Cleaning and Inspection’.

Front panel:
• Lift front insulation panel free from retaining lugs on combustion chamber cover.

Rear panel:
• Pull rear insulation panel free from retaining lug at rear of combustion chamber by tilting forward.
• Fit replacement insulation panels in reverse order to removal.
• Refit combustion chamber cover.

Side panels:
• Pull out side panels.

To replace burner
• Remove burner as described in ‘Routine Cleaning and Inspection’.
Assemble replacement burner, supplied in parts, as follows:
• Fit burner injectors to burner injector bar and tighten.
Note: Make sure that injector size, marked on each injector, is the same as that given in ‘Technical Data’ for the type of gas being used.
• Fit injector bar into burner, secure with retaining rods.
• Fit replacement burner into boiler in reverse order to removal.

To replace burner injectors
• Remove burner as described in ‘Routine Cleaning and Inspection’.
• Pull out injector bar retaining rods and separate injector bar from burner.
• Unscrew and remove injectors from injector bar.
• Fit replacement injectors to injector bar and tighten.
Note: Make sure that injector size, marked on each injector, is the same as that given in ‘Technical Data’ for the type of gas being used.
• Reassemble burner and fit into boiler in reverse order to removal.

To replace ignition electrode
• Remove burner as described in ‘Routine Cleaning and Inspection’.
• Undo and remove screw securing electrode onto burner.
• Fit replacement electrode onto burner in reverse order to removal.
• Refit electrode onto burner in reverse order to removal.
• Refit connection to thermostat.

To replace flame sense electrode
• Remove burner as described in ‘Routine Cleaning and Inspection’.
• Undo and remove screw securing electrode onto burner.
• Fit replacement electrode onto burner in reverse order to removal.
• Refit burner into boiler in reverse order to removal.

To replace central heating expansion vessel
Replacement of the expansion vessel is not possible with the boiler on the wall.
Remove boiler from wall as described in ‘To replace storage vessel thermistor’.
• Undo pipe coupling on expansion vessel.
• Supporting expansion vessel, unscrew and remove screw securing expansion vessel to boiler.
• Lift vessel out of boiler.
• Fit replacement vessel to boiler in reverse order to removal, ensuring that sealing washer is fitted to pipe connection before tightening.
• Ensure that expansion vessel charge pressure is 0.5 bar (7.5 psi) using a pressure gauge. If necessary, increase pressure using a car or cycle tyre pump connected to the Schrader valve.
• Refit boiler onto fixing jig, tighten all connections ensuring that all sealing washers are fitted before tightening.
• Reconnect flue making sure that all joints are properly connected.
• Open isolating valves on flow and return connections, refill, vent and pressurise boiler.
• Check for leaks.
• Reconnect all electrical connections and restore electrical supply.
• Open gas cock, operate boiler and re-check all joints for soundness.

To replace high limit thermostat
• Locate high limit thermostat on heating flow pipe on left hand side of boiler.
• Disconnect electrical connection from thermostat.
• Unclip thermostat from heating flow pipe.
• Fit replacement thermostat in reverse order to removal.
• Refit connection to thermostat.

### Pump 35 kW

![Pump 35 kW diagram](image)
Before trying to operate the boiler make sure that:
- All gas supply cocks are open and that the gas supply has been purged of air.
- The heating system pressure is at least 1 bar.
- There is a permanent mains supply to the boiler.
- The fuse on the PCB is intact.

**WARNING.** Always isolate the boiler from the electrical supply before carrying out any electrical replacement work. Always check for gas soundness after any service work.

Should there be any doubt about the voltage supply to any of the components, it is possible to carry out a simple electrical test to ensure all is operational in that area.

To carry out the electrical test, gain access to the main Printed Circuit Board (PCB), as described previously, and measure the voltages according to Table 1.

**Table 1**

The **ISOFAST** has an on-board fault diagnostic system. Should a fault occur on the boiler, the warning LED at the top of the user display will illuminate and the LCD display will indicate the precise area where the fault has occurred.

A fault code is displayed on the left hand side of the LCD display, whilst at the same time, the letters **FF** appear with a telephone symbol.
## FAULT FINDING

**INSTRUCTIONS FOR USE**

**Lighting**:
- Make sure that:
  - the boiler is connected to the electrical supply,
  - the gas service tap is open,
  - Switch ON (I).

**Switch off the boiler**: Switch to OFF (O): the electrical supply is off. Stop the gas supply if the boiler is to be out of use for a long time.

In case of fault, the red warning light will flash and a code appears on the boiler display.

**Code 21**: Water pressure too low: open the blue tap (t) situated under the boiler until a pressure of 1.5 bar is obtained.

**Operation without room thermostat**:
- Press the key (the key will light-up).
- Press the and/or buttons to activate the heating and/or hot water functions.
- Use buttons and to determine the heating and hot water temperatures.
- To revert to the operating mode with room thermostat, again press the key (the light will turn OFF).

**Fault indication**:

In case of fault, the red warning light will flash and a code appears on the boiler display.

**Code 21**: Water pressure too low: open the blue tap situated under the boiler until a pressure of 1.5 bar is obtained.

**Other codes**: press the key of the room thermostat and read the indications given by the display.

---

**Important information**

The instructions consist of three parts, User, Installation and Servicing Instructions, which includes the Guarantee Registration Card. The instructions are an integral part of the appliance and must comply with the current issue of the Gas Safety (Installation and Use) Regulations, be handed to the user on completion of the installation.

**Gas Safety (Installation and Use) Regulations**

In your own interests and that of safety, it is the Law that ALL gas appliances are installed by a competent person in accordance with the current issue of the above regulations.

**Gas Testing and Certification**

The boiler is tested and certificated for safety and performance. It is, therefore, important that no alteration is made to the boiler unless approved, in writing, by Saunier Duval. Any alteration not approved by Saunier Duval, could invalidate the certification, boiler warranty and may also infringe the current issue of the statutory requirements.

**CE Mark**

This boiler meets the requirements of Statutory Instrument, No. 3083 The Boiler (Efficiency) Regulations, and therefore is deemed to meet the requirements of Directive 92/42/EEC on the efficiency requirements for new hot water boilers fired with liquid or gaseous fuels. Type test for purposes of Regulation 5 certified by: Notified body 0086. Product/production certified by: Notified body 0086.

---

Important information

The CE mark on this appliance shows compliance with:

Control of Substances Hazardous to Health
Under Section 6 of The Health and Safety at Work Act 1974, we are required to provide information on substances hazardous to health.
The adhesives and sealants used in this appliance are cured and give no known hazard in this state.

Insulation Pads
These can cause irritation to skin, eyes and the respiratory tract.
If you have a history of skin complaint you may be susceptible to irritation. High dust levels are usual only if the material is broken.
Normal handling should not cause discomfort, but follow normal good hygiene and wash your hands before eating, drinking or going to the lavatory.
If you do suffer irritation to the eyes or severe irritation to the skin seek medical attention.

Gas Leak or Fault
If a gas leak or fault exists or is suspected, turn the boiler mains electrical supply off and turn off the gas supply at the meter. Consult your local gas company or your local installer/servicing company.

Plumbing from flue terminal
Like all condensing boilers this appliance will produce a plume of condensation from the flue terminal in cool weather. This is due to the high efficiency and hence low flue gas temperature of the boiler. It is normal and not a fault indication.

Replacement Parts
If replacement parts are required contact Saunier Duval service using the telephone number on the back cover of this booklet.
Please quote the name of the appliance this information will be on the front of the appliance.

Protection Against Freezing
The room thermostat automatically ensures a minimum installation temperature of 6°C. This protection is ensured by the room thermostat as long as it is active. This means that the ▼ button of the boiler must not be lit and that the batteries of the room thermostat must be in good condition.
If you are out of home for a few days, use the holidays mode of your room thermostat, and set the Start and End dates, as well as the desired temperature.

Access to the user menu:

- **HOLIDAYS**
  - START DATE
  - END DATE
  - SET ROOM T°
  - CANCEL

Draining and Filling
This boiler works in a pressurised system, which must only be drained, refilled and pressurised by a competent person.

Pressure Relief Safety Valve
A pressure relief safety valve and discharge pipe is fitted to the boiler. This valve must not be touched. Should there be any discharge from the pipe, isolate the boiler and contact your installer or Saunier Duval service using the telephone number on the back cover of this booklet.

Manual Handling Guidance
During the appliance installation and the replacement of the heat exchanger it will be necessary to employ caution and assistance whilst lifting as the appliance or component exceeds the recommended weight for a one man lift.
In certain situations it may be required to use a mechanical handling aid. Take care to avoid trip hazards, slippery or wet surfaces.

Boilers Installed in a Compartment or Cupboard
If the boiler is fitted into a compartment or cupboard, it does not require any ventilation openings. Do not use the compartment or cupboard for storage.

Gas Leak or Fault
If a gas leak or fault exists or is suspected, turn the boiler mains electrical supply off and turn off the gas supply at the meter. Consult your local gas company or your local installer/servicing company.

Electrical Supply Failure
The boiler must be earthed. The boiler will not work without an electrical supply. Normal operation of the boiler should resume when the electrical supply is restored.
Reset any external controls, to normal operation of the central heating.
If the boiler does not resume normal operation turn the mains reset switch off and on. If the boiler does not resume normal operation after this the overheat stat may have operated. The overheat stat would only operate under abnormal conditions and, under these circumstances; it would be advisable to consult your installation/servicing company.

Insulation Pads
These can cause irritation to skin, eyes and the respiratory tract.
If you have a history of skin complaint you may be susceptible to irritation. High dust levels are usual only if the material is broken.
Normal handling should not cause discomfort, but follow normal good hygiene and wash your hands before eating, drinking or going to the lavatory.
If you do suffer irritation to the eyes or severe irritation to the skin seek medical attention.

If the mains electricity and gas are to be turned off for any long periods during severe weather, it is recommended that the whole system, including the boiler, should be drained to avoid the risk of freezing.
Contact your installation/servicing company as draining, refilling and pressurising MUST be carried out by a competent person.

As a safety feature the boiler will stop working if the condensate drain becomes blocked. During freezing conditions this may be due to the forming of ice in the condense drain external to the house. Release an ice blockage by the use of warm clothes on the pipe. The boiler should then restart. Contact your installer or Saunier Duval service using the telephone number on the back cover of this booklet.

Access to the user menu:
To ensure the continued efficient and safe operation of the appliance it is recommended that it is checked and serviced as necessary at regular intervals. The frequency of servicing will depend upon the particular installation conditions and usage, but in general once a year should be enough. Refer to Section «Routine Cleaning and Inspection».

If this appliance is installed in a rented property there is a duty of care imposed on the owner of the property by the current issue of the Gas Safety (Installation and Use) Regulations, section 35. Servicing/maintenance should be carried out by a competent person in accordance with the rules in force in the countries of destination.

To obtain service, please call your installer or Saunier Duval service using the telephone number on the back cover of this booklet.

Please be advised that the ‘Benchmark’ logbook should be completed by the installation engineer on completion of commissioning and servicing. All CORGI Registered Installers carry a CORGI ID card, and have a registration number. Both should be recorded in your boiler Logbook. You can check your installer is CORGI registered by calling CORGI direct on: 01256 372300.

Cleaning
The boiler casing can be cleaned with a damp cloth followed by a dry cloth to polish. Do not use abrasive or solvent cleaners.

Boiler casing
CAUTION. Do not remove or adjust the casing in any way, as incorrect fitting may result in faulty operation. If in doubt, consult your installation/service company.
Your Isofast boiler is factory set to operate within a customary installation.

Nevertheless, as many installations may incorporate specific features, feel free to contact your installer who will be able – by adapting the parameters of the boiler (maximum temperature and/or maximum power of the heating system) - to warrant you the best operating performance of your installation.

These settings being made, you still have the possibility of selecting the ambient temperature to suit your own requirements not only when you are at home, but also during nighttime or when you are out.

All these settings are achieved from the room thermostat supplied together with your boiler: if you accurately determine the temperatures that best suit to your needs, you will make significant savings in terms of gas consumption.

**Essential adjustments to the wireless room thermostat:**
- **A** - Setting the time
- **B** - Setting the date

**The thermostat's weekly programme functions enable you:**
- **C** - To activate or deactivate the heating function.
- **D** - To have a standard weekly programme by activating the programme pre-set at the factory.
- **E** - To bypass the current programme, temporarily, to increase or lower the temperature at any time during the day.
- **F** - To set up a custom programme for each day of the week, with 2 temperature levels, for example:
  - COMFORT for the periods you are present and.
  - ECO at night or when you are away.
- **G** - To have the same temperature 24 hours a day by deactivating the programme.
- **H** - To leave on holiday, determining the desired temperature according to the date you leave and when you return.
- **I** - To select the temperature of your domestic hot water from 38°C to 60°C.
  However, keeping the temperature below 50°C, reduces gas consumption and provides good protection against scalds.
- **J** - To prevent undesired alterations to your settings by locking the thermostat's buttons.
- **K** - To be informed of any operating faults in the boiler and be instructed in the procedure to follow.

**Control as a source of savings**

**1** - Display
**2** - Fault indicator.
**3** - Return to previous menu
**4** - Confirm OK.
**5** - Access to the menus.
**6** - Menu scrolling
**7** - Changing the mode
**8** - Wall bracket
**9** - Mains power plug

**Indicators of the current temperature levels for “COMFORT” or “ECO” (Day/Night).**
**Time period for the ECO temperature**
**Low battery indicator**
**Hot water mode indicator**
**Heating demand indicator**

**Fault description**

**SYSTEM PRESSURE TOO LOW FILL IN AT 1.5 BAR**

(Attention: this value may vary when you hold the thermostat in your hand).
Control as a source of savings

A and B Settings for the time and the date

Progress of the operations: Please note that pressing button C at any time takes you back to the previous step.

1 - Accessing the user menu

• Press MENU to call up the next menu:

<table>
<thead>
<tr>
<th>UTILITY</th>
<th>SET COMFORT T1</th>
<th>SET ECO T1</th>
<th>PROGRAMME</th>
<th>SET HOT WATER T1</th>
<th>ON/OFF HEATING</th>
<th>HOLIDAYS</th>
<th>SET TIME</th>
<th>SET DATE</th>
</tr>
</thead>
</table>

2 - Setting the time

• Use the buttons to select the “Set time” menu:

<table>
<thead>
<tr>
<th>SET TIME</th>
<th>→ OK</th>
<th>→ 17:23</th>
<th>→ + OK</th>
</tr>
</thead>
</table>

3 - Setting the date

• Use the buttons to select the “Set date” menu:

<table>
<thead>
<tr>
<th>SET DATE</th>
<th>→ OK</th>
<th>→ TUE 14/JUL/03</th>
<th>→ + OK</th>
</tr>
</thead>
</table>

C Activating/deactivating the heating function

1 - Activate the heating

<table>
<thead>
<tr>
<th>ON/OFF HEATING</th>
<th>→ OK</th>
<th>→ OFF</th>
<th>→ ON</th>
<th>→ OK</th>
</tr>
</thead>
</table>

2 - Deactivate the heating

<table>
<thead>
<tr>
<th>ON/OFF HEATING</th>
<th>→ OK</th>
<th>→ ON</th>
<th>→ OFF</th>
<th>→ OK</th>
</tr>
</thead>
</table>

D Activating the initial programme

Progress of the operations: Please note that pressing button C at any time takes you back to the previous step.

1 - Activating the weekly programme

• Press PROG, the room thermostat shows this display:

| + | PROGRAMME OFF |
| - | PROGRAMME ON |

• When the ON mode appears, wait 5 seconds for the display to return to normal position and automatically validate the selection.

2 - Accessing the initial programme

• Press MENU + to select the “Programme” menu:

<table>
<thead>
<tr>
<th>PROGRAMME</th>
<th>→ OK</th>
<th>→ INITIAL PROGRAMME</th>
<th>→ OK</th>
</tr>
</thead>
</table>

• Exit from the menu by pressing C, which initiates the standard weekly programme preset at the factory:

Monday to Friday

<table>
<thead>
<tr>
<th>ECO</th>
<th>COMFORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>11 PM &gt;&gt; 6 AM</td>
<td>8 AM &gt;&gt; 4 PM</td>
</tr>
</tbody>
</table>

Weekends

<table>
<thead>
<tr>
<th>ECO</th>
<th>COMFORT</th>
</tr>
</thead>
<tbody>
<tr>
<td>11 PM</td>
<td>7 AM &gt;&gt; 11 PM</td>
</tr>
</tbody>
</table>

ECO temperature 16°C
COMFORT temperature 19°C

E Temporarily bypassing the weekly programme

• Pressing one of the scroll buttons calls up the menu for setting the ambient temperature:

| SET ROOM T1 | → OK |

This setting is automatically cancelled when the programme changes to Eco or Comfort temperature level.
Control
as a source of savings

Setting the custom weekly programme

Progress of the operations: Please note that pressing button at any time takes you back to the previous step.

1 - Activating the weekly programme
- Press , the room thermostat shows this display:
- Pressing reverses ON and OFF mode every time.
- When the ON mode appears, wait 5 seconds for the display to return to normal position and automatically validate the selection.

2 - Access to the user menu
- Press to call up the next menu:

3 - Setting the Comfort temperature
- (to set the desired temperature during the day)

4 - Setting the Eco temperature
- (to set the desired temperature during the night or while you are away)

5 - Programme
- (to allocate time periods for the Comfort and Eco temperatures)

The squares indicate the time periods when the boiler will provide the COMFORT temperature level (e.g.: 19.5°C between 4 PM and 11 PM and 6 AM and 8 AM)

The blanks indicate the time periods when the boiler will provide the ECO temperature level (e.g.: 16.5°C between 8 AM and 4 PM and 11 PM and 6 AM)

This symbol indicates the mode authorising deletion of black squares to set up operating periods at the stated ECO temperature using the buttons .

E.g.: In the case of the illustration opposite, each press of the button adds a blank from 6 AM onwards, corresponding to an extra 30 minutes heating at 16.5°C.

This symbol indicates the mode authorising additional operating periods at the stated COMFORT temperature (black squares) using the buttons .

E.g.: In the case of the illustration opposite, each press of the button adds a square from 11 PM onwards, corresponding to an extra 30 minutes heating at 19.5°C.

- Press to confirm the parameters you have set for the day.

- Follow the same procedure for every day of the week or use the duplication function, as explained below.

Duplicating a programme
- To save time, you can copy the parameters you have set onto another day via the menu:

Please note that pressing button at any time takes you back to the previous step.
**Control as a source of savings**

### Setting the heating temperatures outside Programme mode

**Progress of the operations:** Please note that pressing button at any time takes you back to the previous step.

<table>
<thead>
<tr>

General Information

IMPORTANT NOTICE
The boiler and pipes are supplied in one pack, the flue is supplied separately. This boiler is factory set for use only on G20 natural gas.

Where no British Standards exists, materials and equipment should be fit for their purpose and of suitable quality and workmanship. Refer to Manual Handling Operations, 1992 regulations.

The installation of this boiler must be carried out by a competent person in accordance the rules in force in the countries of destination.

Manufacturer’s instructions must not be taken as overriding statutory requirements.

Sheet Metal Parts
WARNING: When installing the appliance, care should be taken to avoid any possibility of personal injury when handling sheet metal parts.

Statutory Requirements
The installation of the boiler MUST be carried out by a competent person in accordance with the relevant requirements of the current issue of: Manufacturer’s instructions, supplied.

The Gas Safety (Installation and Use) Regulations, The Building Regulations, The Building Standards (Scotland) Regulations (applicable in Scotland), local Water Company Bylaws, The Health and Safety at Work Act, Control of Substances Hazardous to Health, The Electricity at Work Regulations and any applicable local regulations. Detailed recommendations are contained in the current issue of the following British Standards and Codes of Practice, BS4814, BS5440 Part 1 and 2, BS5449, BS5546, BS6700, BS6798, BS6891 and BS7074 Part 1 and 2, BS7478, BS7593, BS7671.

We also suggest that you have to hand a copy of the British Gas publication, “Guidance Notes for the Installation of Domestic Condensing Boilers”.

Manufacturer’s notes must not be taken as overriding statutory obligations.

Certification
This boiler certified to the current issue of EN 483 for performance and safety. It is important that no alteration is made to the boiler, without permission, in writing, from Saunier Duval.

Any alteration that is not approved by Saunier Duval, could invalidate the warranty and could also infringe the current issue of the Statutory Requirements.

Electrical Supply
All system components shall be of an approved type and all wiring to current I.E.E. wiring regulations. External wiring must be correctly earthed, polarised and in accordance with the relevant standards.

In GB this is BS 6891.
In IE this is the current edition of I.S.813 “Domestic Gas Installations”.

The boiler must be connected to a permanent 230V ac, 50Hz supply. Connection of the whole electrical system of the boiler, including any heating controls, to the electrical supply must be through one common isolator and must be fused 3 Amp maximum.

Wiring to the boiler must be PVC 85°C insulated cable, not less than 0.75mm² (24/0.20mm).

Certification
The boiler is delivered in one package:
- the boiler itself, the wireless thermostat, the fixing bracket, the template and pipe connections.

The “as delivered” package consists of:
- 1 wireless thermostat
- 1 fixing bracket
- 3 x 1.5 V alkaline battery cells type LR6
- 1 access cover to the battery cells

ATTENTION: DO NOT FORGET TO RECOVER THE ROOM THERMOSTAT placed in a polystyrene case in the bottom of the package.

Dimensions
The different packages relating to the flue system will be ordered depending on the actual configuration of the installation.

**Gas Supply**

The gas installation must be in accordance with the relevant standards. In GB this is BS6891. In IE this is the current edition of I.S.813 "Domestic Gas Installations".

On completion, test the gas installation for soundness using the pressure drop method and suitable leak detection fluid, purge in accordance with the above standard.

The Seasonal Efficiency Domestic Boilers UK (SEDBUK) is Band 'A'.

The value is used in the UK Government's Standard Assessment Procedure (SAP) for energy rating of dwellings. The test data from which it has been calculated has been certified by B.S.I.

**Technical Data**

All dimensions are given in millimetres (except as noted). The data label is positioned on the inner door.
**Bypass**

The Isofast boiler has a built-in bypass. This must be adjusted according to the requirements of the system, refer to the flow rate pressure curve. The boiler is supplied with the built-in bypass open a half a turn. It is adjusted by turning the bypass screw (a).

Turn the screw clockwise to close the bypass. When using thermostatic radiator valves (TRVs) on all of the radiators, it is essential that a separate, adjustable bypass of 15 mm minimum diameter is fitted between the flow and return of the heating circuit. Any bypass must be fitted before system controls.

**NB:** Factory setting: Speed II

E - Gas
installed in a timber frame building it should be fitted in accordance with the Institute of Gas Engineers document IGE/UP/7/1998. If in doubt seek advice from the local gas undertaking or Saunier Duval.

- The boiler is room sealed, so when it is installed in a room or space, a permanent air vent is not required.
- Due to the high efficiency and hence low casing temperature of this boiler, cupboard or compartment ventilation is not necessary.

**Boiler location**

- This boiler is not suitable for outdoor installation.
- This boiler may be installed in any room, although particular attention is drawn to the installation of the local gas undertaking or Saunier Duval.
- The boiler should be positioned so that at least the minimum operational and servicing clearances are provided, see diagram.
- The boiler should be fitted in alignment with the relevant requirements. In GB this is the current I.E.E. WIRING REGULATIONS and BUILDING REGULATIONS. In IE reference should be made to the current edition of IS 813 "Domestic Gas Installations" and the current ETCI rules.

**If the boiler is not immediately installed, protect the different couplings so that no plaster or paint could jeopardize the tightness of subsequent connections.**
Flue location and Ventilation

**Warning notice:**
Use only flue accessories developed for Saunier Duval condensing boilers.

**Flue Position and Length**
The standard horizontal flue is fitted onto the top of the boiler using the flue elbow. See diagrams to determine whether a standard flue can be used.

An elevated flue system can be installed with the addition of a vertical flue adapter, extension kits and elbow, see section flue options.

When extension pipes are used the flue system must be designed to have a continuous fall to the boiler of at least 3% to allow condensate to run back into the boiler and out via the drain.

**Internal Flue Installation**
The flue can be installed from inside the building, when access to the outside wall face is not practicable.

Additional accessories are available. See Saunier Duval “Flue Options Guide” for configurations available.

**Minimum sitting dimensions for fanned flues terminals portions**

**Horizontal flues**
- A - directly below an opening, air brick, opening windows .......................... 300
- B - above an opening, air brick, opening windows .......................... 300
- C - horizontally to an opening, air brick, opening windows ......................... 300
- D - below gutter, drain/soil pipe ............................................... 25
- E - below eaves ................................................................. 25
- F - below a balcony or car port .................................................. 25
- G - from vertical drain pipes and soil pipes ....................................... 25
- H* - to a boundary alongside the terminal ........................................... 300
- I - above adjacent ground or balcony level ............................... 300
- J - from surface or a boundary facing the terminal ............................. 600
- K - facing terminals ............................................................... 1200
- L - from opening (door/window) in car port into dwelling .................. 1200
- M - vertical from a terminal ..................................................... 1500
- N - horizontally from a terminal ................................................ 300

**Vertical flues**
- P - from another terminal ..................................................... 600
- Q - above roof level ............................................................. 300
- R - from adjacent opening window ........................................... 1000
- S - from adjacent wall to flue .................................................. 300

H* and J* : These dimensions comply with the building regulations, but they may need to be increased to avoid wall staining and nuisance from pluming depending on site conditions.
Flue location and Ventilation

**Horizontal flues (installation type C13)**

The maximum head loss is reached with an elbow and flue system length (L) of **10 m**.

**Terminal Position**

The minimum acceptable sitting dimensions for the terminal from obstructions, other terminals and ventilation openings are shown in page 29. For Ireland the minimum distances for flue terminal positioning must be those detailed in I.S.813 "Domestic Gas Installations".

The terminal must be exposed to the external air, allowing free passage of air across it at all times.

Being a condensing boiler some pluming may occur from the flue outlet. This should be taken into consideration when selecting the position for the terminal.

It may be necessary to increase dimensions H & J if there is a risk that the boiler products could stain any adjoining surface.

Carports or similar extensions of a roof only, or a roof and one wall, require special consideration with respect to any openings, doors, vents or windows under the roof. Care is required to protect the roof if made of plastic sheeting. If the carport comprises of a roof and two or more walls, seek advice from the local gas supply company before installing the boiler.

**Terminal Guard**

A terminal guard is required if persons could come into contact with the terminal or the terminal could be subject to damage. If a terminal guard is required, it must be positioned to provide minimum of 50mm clearance from any part of the terminal and be central over the terminal.

---

The flue system pipes must feature a slope of **3%** towards the boiler in order to recover any condensates. **Attention**: The flue system terminal supplied by Saunier Duval already integrates this slope. Therefore, it shall be applied to any flue system extensions.
Heating system

General
The boiler is for use only with sealed central heating systems. The safety valve is an integral part of the boiler and it cannot be adjusted. The digital readout on the controls fascia indicates the system pressure when there is no central heating demand. The circulation pump is integral with the boiler.

Expansion vessel
The boiler has an integral expansion vessel with a capacity of 10 litres, with a charge pressure of 0.5 bar.

Note: The expansion vessel volume depends on the total water system volume and the initial system design pressure. Guidance on vessel sizing is also given in the current issue of BS5449 and BS7074 Part 1, for IE refer to the current edition of I.S.813 "Domestic Gas Installations".

Flow rate
If it is necessary to alter the flow rate, the system can be fitted with a lockable balancing valve in the main flow or return pipes shown as valve "A" in diagram. The flow rate through the boiler must not be allowed to fall below 14 l/min.

Bypass
The boiler is fitted with an adjustable automatic bypass. Ensure that under no circumstances does the flow rate drop below 14l/min.

The installation of the boiler must comply with the requirements of the current issue of BS6798, in Ireland, refer also to the current edition of I.S.813 "Domestic Gas Installations".

In GB it is necessary to comply with the Water Supply (Water Fittings) Regulations 1999 (for Scotland, the Water Byelaws 2000, Scotland).

To comply with the Water regulations your attention is drawn to: The Water Regulations guide published by the Water Regulations Advisory Service (WRAS) gives full details of the requirements.

In IE the requirements given in the current edition of I.S.813 "Domestic Gas Installations" and the current Building Regulations must be followed.

Water treatment:
In the case of an existing installation, it is ESSENTIAL that prior to installing the new boiler the system is thoroughly flushed. For optimum performance after installation of a new system, the boiler and its associated central heating system should also be flushed. Flushing should be carried out in accordance with BS7593: 1992 using a cleanser such as Sentinel X300 or X400, Fernox Superfloc or Salamander corrosion guard cleaner.

Bypass must be used, refer to the current issue of BS 5449 and BS 7593 on the use of inhibitors in central heating systems. Examples are Sentinel X100 Fernox or Salamander corrosion guard inhibitor.

Draining Tap
A draining tap must be provided at the lowest points of the system, which will allow the entire system to be drained.

A drain tap for the appliance is provided as an integral part of the hydroblock, see diagram page 24.

Domestic Hot Water System

For GB: Guidance G17 to G24 and recommendation R17 to R24 of the Water Regulations Guide.

For IE: The current edition of I.S.813 "Domestic Gas Installations".

Water Pressure
The maximum working pressure of the domestic hot water circuit is 10 bar. If the cold water supply pressure exceeds this, then a pressure-reducing valve must be fitted in the supply to the boiler.

*Hard* Water Areas
The temperatures within the heat exchanger are limited by the boiler control system to minimise scale formation within the hot water pipework. However, in areas where the water is ‘hard’ (i.e. more than 200mg/litre), it is recommended that the hot water setting is reduced and that a scale reducer is fitted. Refer to the manufacturer’s instructions or consult the local water company for additional advice.

Domestic Water Flow Rate
The water flow rate is restricted to a maximum 16 l/min by a restrictor fitted on the cold water inlet.
Boiler installation

Prior to performing any operation, it is essential that the piping systems be flushed with a suitable product in order to eliminate any impurities such as filings, weld spatters, oils and greases.

Such foreign materials could be driven into the boiler, and could impair its operation. NB: Solvents may cause damages to the piping system. Remove the wooden beam placed behind the boiler.

Appliance Connection

IMPORTANT: With regards to the Manual Handling Operations, 1992 Regulations, the following lift operation exceeds the recommended weight for a one man lift, refer to Manual Handling section, on page 4. The appliance will contain a small amount of water; place a water container beneath the boiler connections before removing the protective caps.

1 - Lifting the boiler into position, lean the top of the boiler slightly to the wall and position just above the hanging bracket.

2 - Lower the boiler slowly and engage onto the hanging bracket.

Connect isolating valves using washers and domestic flow restrictor supplied with the boiler.

3 - Do not forget to connect the blue extension on the filling tap, as shown on the picture below.

Piping installation

Make connections to boiler, gas, water and heating cocks with the tube assemblies supplied in piping pack as shown in the diagram below:

A - Heating return with isolating tap (t) and (u),
B - Cold water inlet with isolating tap (v) and water restrictor to 16 l/min,
C - Heating flow with isolating tap (w),
D - Domestic hot water outlet,
E - Gas inlet with isolating tap (x).

Gas Connection

Before connection check supply of local gas. Refer also to page 18. Do not subject the gas service cock to heat. Fit the sealing washer into the union nut and make good the connection to the gas service cock on the wall.

Make sure the on / off lever is accessible. The whole of the gas installation, including the meter, should be inspected, tested for soundness and purged in accordance with the current issue of BS6891 and in IE the current edition of I.S.813 “Domestic Gas Installations”.

A - C: Central heating Ø 22 mm
B - D: Domestic hot water Ø 15 mm
E: Gas supply Ø 15 mm
Piping Installation

Water Connections
Flush out the domestic hot water and the heating systems before connecting to the boiler.
Make the connections to the domestic hot water and heating systems by fitting the sealing washers into the securing nuts and make good the connection to the isolating valves.
Do not subject the isolation valves to heat.
Make sure the drain point is accessible.

- The heating return coupling is equipped with a filter, accessible after removing the end nut.

- The proof-test pressure can be read on a pressure gauge screwed instead of the heating return coupling end nut (A).

Safety Discharge Valve
The pipes from the safety discharge valves S1 and S2 must not discharge above an entrance, window or any type of public access area.
Take the short safety discharge tube, union nut and seal, supplied loose in the boiler fittings pack and fit as shown in diagram below.
This must be extended, using not less than 15mm o.d. pipe, to discharge, in a visible position, outside the building, facing downwards, preferably over a drain.
The pipe must have a continuous fall and be routed to a position so that any discharge of water, possibly boiling, or steam cannot create any danger to persons, damage to property or external electrical components and wiring.

To ease future servicing it is advisable to use a compression type fitting supplied with the boiler to extend the safety discharge valve tube.
**INSTALLERS**

### Piping installation

**Connect the A elbow Ø 22 mm** to a discharge system leading to the sewer, in compliance with the instructions below:

- Use a rigid PVC tube or a flexible silicon pipe resistant to condensate.
- The pipe must have a continuous fall.
- Do not use copper pipes

**Important notice:**

The float of the condensate recovery system also ensures fume tightness. Therefore, it is useless to add water in the condensate box.

---

### Electrical connection

Electrical components have been tested to meet the equivalent requirements of the BEAB. Do not interrupt the mains supply with a time switch or programmer. Connection of the whole electrical system and any heating system controls to the electrical supply must be through a common isolator.

Isolation should preferably be by a double pole switched fused spur box having a minimum contact separation of 3mm on each pole. The fused spur box should be readily accessible and preferably adjacent to the boiler. It should be identified as to its use.

**WARNING:** This appliance must be earthed.

This appliance must be wired in accordance with these instructions. Any fault arising from incorrect wiring cannot be put right under the terms of the Saunier Duval guarantee. All system components must be of an approved type.

**Mains Cable**

Important: If a replacement supply cable is required it must be purchased from Saunier Duval.

- The 630 mA fuse of the PCB must be connected to the neutral.

---
INSTALLERS

Commissioning on boiler

Please ensure the "Benchmark" logbook is completed and left with the user.

The commissioning and first firing of the boiler must only be done by a qualified registered person.

Make sure that the boiler is connected to the electrical supply and the gas service cock is open.

Filling the system 1 to 8

1. Switch ON (I).

2. Open the isolating taps (t), (u), (v) and (w) on boiler: slot in line with the length of the valve.

3. Undo cap on automatic air vent on top of pump and leave undone.

4. Fill the system until the pressure indicated on the display is between 1 and 2 bar. Close filling device.

5. Bleed each radiator to remove the air, re-tighten bleed screws.

6. Leave the cap on the pump auto air vent open.

7. Open various hot water taps to bleed system.

8. Make sure the display indicates a system pressure of between 1 and 2 bar. Re-fill system as necessary.
Press the key to operate the boiler without room thermostat.

- Adjust heating temperature to maximum.

- Allow the temperature to rise to the maximum value, with all radiator valves open. The temperature rise will cause release of the gases contained in the water of the central heating system.

- Gases driven towards the boiler will be automatically released through the automatic air vent.

- The gases trapped at the highest point of the system must be released by bleeding the radiators. Check the burner gas rate required, ten minutes from lighting. Refer to Data Label on electrical controls box. Should there be any doubt about the gas rate it should be checked at the meter. On reaching maximum temperature, the boiler should be turned off and the system drained as rapidly as possible whilst still hot.

Instruct the User
- Instruct and demonstrate the lighting procedure and advise the user on the safe and efficient operation of the boiler.
- Instruct on and demonstrate the operation of heating system control.
- Advise the user on the use and maintenance of any scale reducer and pass on any relevant instructional documents.
- Advise that to ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the installation conditions and usage, but in general, once a year should be enough.
- Draw attention, if applicable, to the current issue of the Gas Safety (Installation and Use) Regulations, Section 35, which imposes a duty of care on all persons who let out any property containing a gas appliance in the UK.
- The user shall not interfere with or adjust sealed components.
- It is the Law that any servicing is carried out by a competent person.
- Advise the user that, like all condensing boilers this appliance will produce a plume of condensation from the flue terminal in cool weather. This is due to the high efficiency and hence low flue gas temperature of the boiler.
- Advise the user of the precautions necessary to prevent damage to the system, boiler and the building, in the event of the heating system being out of use during frost or freezing conditions.
- Advise the user that the permanent mains electrical supply SHOULD NOT be switched off, as the built in frost protection and pump/valve saver program would not be operable.
- Reminder, leave these instructions and the ‘Benchmark’ logbook with the user.
- For IE, it is necessary to complete a “Declaration of Conformity” to indicate compliance to I.S.813. An example of this is given in the current edition of I.S.813.
Commissioning on room thermostat

The wireless room thermostat (R.O.) has been specially developed for the Isofast.
- It is powered by 3 LR6 1.5V alkaline batteries.

- The boiler’s various functions are parametered from the room thermostat.

Installing the room thermostat
- Fasten the bracket for the room thermostat on an internal wall approximately 1.50 m from the floor, in an area sheltered from direct sunlight and any source of interference, such as television, lamps, draughts, etc.
- Insert the batteries in the thermostat.

When commissioning for the first time, at initial commissioning stage, the boiler automatically shifts to manual mode (the control panel keys are lit, and the key is blinking), thus meaning that the wireless room thermostat has not yet been acknowledged by the boiler. To do this:
- Open the control panel
- Locate connector (A) on the left-hand side and insert it in the thermostat for a few seconds as shown in the photo opposite.
- When the red indicator light stops flashing, this shows that the boiler has recognised the thermostat.

Settings

Access to the boiler’s technical data (reserved for use by the installers and After-Sales service personnel). This enables adjustments to be made and any malfunctions to be analysed:

The description below specifies the operations to be performed to make adjustments to an installation fitted with radiators or for a direct floor system. For other types of installation (for example with a floor-heating system), follow the instructions in the appropriate accessories manual.

Your installation consists of a single radiator zone or direct floor system

Progress of the operations: Please note that pressing button at any time takes you back to the previous step.

1 - Accessing the installer menu
- Connect connector (A) to the room thermostat as detailed on the previous page.
- Press for 5 seconds to call up the following menu:
- Select installer menu:
  - INSTALLER MENU
  - AFTER SALES MENU
  - FAULT HISTORY
  - BOILER DATA

2 - Select the language
- Select the language
- OK

3 - Installation configuration
- INSTALLATION TYPE
- OK
- RADIATOR ZONE
- OK
Settings

4 - Radio accessories

Warning: This menu must only be used when installing one or more of these accessories. Please refer to the section on “Activating the accessories”.

- RADIO SATELLITE → OK → IN OUTDOOR SENSOR → OFF
- THERMOSTAT 2 → OFF
- MODEM → OFF

5 - Heating control

- HEATING CONTROL → OK → HEATING SETPOINT → OK → AUTO
- MANUAL

Selecting AUTO is recommended so that you can benefit from automatic circuit temperature control.

However, if you wish to adjust the radiator temperature yourself, select MANUAL. Then return to the user menu to set the radiator temperature.

6 - Boiler configuration

- BOILER CONFIG. → OK → MAX OUTPUT, CHIMNEY SET, MAX RADIATOR T₁, MIN RADIATOR T₁, PUMP MODE

6.1 Limiting the maximum heating power

- MAX OUTPUT → OK

- OK

- OK

- OK
**INSTALLERS**

**Settings**

### Accessories settings 1/3

**Progress of the operations:** Please note that pressing button C at any time takes you back to the previous step.

**1. Access to the Radio accessories menu**
- Connect connector (A) on the room thermostat as described page 44.
- Press MENU for 5 seconds to call up the following menu: INSTALLER MENU, AFTERSALES MENU, FAULT HISTORY, BOILER CONFIG.
- Select the installer menu:
  - INSTALLER MENU → OK → ACCESS CODE → OK → RADIO ACCESSORIES
- Select the Radio accessories menu:
  - RADIO ACCESSORIES → OK → EXT. SENSOR OFF, REPEATER OFF, THERMOSTAT 2 OFF, MODEM OFF.

### Accessories settings 2/3

#### 2.2 Heating setpoint

- Reach into the Heating Set Point menu to select the desired regulating mode.
  - EXT. SENSOR ON → C → HEATING REGULATION → BOILER CONFIG → OK
  - DETAILS

**a/ Heating setpoint**
- HEATING SETPOINT → OK → AUTO
- MANUAL

The **AUTO** setting is recommended to obtain automatic regulation of circuit temperatures. In such case, no slope adjustment is required. The boiler will itself select, after a few days, the slope which is the most suited to the heating installation.

**b/ T° heating off**
- T° HEATING OFF → OK → HEATING SETPOINT

Note: we recommend selecting 17 or 18°C.

---

**You may retain the advantages conferred by the external sensor, while setting yourself the slopes of the sensor. Select the **MANUAL** setting and adapt the following parameters:**

- SLOPE ZONE 1 → OK → 0.2 → 0.3 → 0.5 → 0.7 → 0.9 → OK
- SLOPE ZONE 2 → OK → 1.1 → 1.3 → 1.5 → 1.7 → 2.0 → OK
- CORRECT T° ZONE 1 → OK → -5°C → -1°C → 0°C → 5°C → OK
- CORRECT T° ZONE 2 → OK → -5°C → -1°C → 0°C → 5°C → OK

Select the code following curves given on diagram below.

NB: Zone 2 settings are only displayed when two heating zones have been selected in the "config. Installation" menu.

---

**2.1 External sensor recognition**

- EXT. SENSOR OFF → OK → CONNECT → OK

Hold the satellite button, situated on the backside of the external sensor box, depressed for 10 seconds.

To establish connection, the sensor transmits signals - this may require several minutes - until it is acknowledged by the room thermostat which then validates the connection through the following display:

- EXT. SENSOR ON, REPEATER OFF, THERMOSTAT 2 OFF, MODEM OFF.

The external sensor is now operating.
Selecting the language on the thermostat’s display.

Selecting the type of heating installation.

The ON position of this menu assigns the TA1 clock function to the radiator zone. In such case, the ambient temperature at floor level is selected from the TA1 user’s menu.

Activating the various radio accessories on the installation.

Selecting Automatic or Manual control mode.

In Automatic mode, the radiator temperature adapts automatically to the heating requirements of the room in which the thermostat is located, operating between the maximum and minimum temperature values set.

Selecting the boiler’s main operating parameters (power and heating circuit temperatures, pump mode and airflow configuration).

Glossary for the installer menu

Select the language | Selecting the language on the thermostat’s display.
Installation config. | Selecting the type of heating installation.
Clock zone 2 | The ON position of this menu assigns the TA1 clock function to the radiator zone. In such case, the ambient temperature at floor level is selected from the TA1 user’s menu.
Radio accessories | Activating the various radio accessories on the installation.
Heating regulation | Selecting Automatic or Manual control mode. In Automatic mode, the radiator temperature adapts automatically to the heating requirements of the room in which the thermostat is located, operating between the maximum and minimum temperature values set.
Boiler config. | Selecting the boiler’s main operating parameters (power and heating circuit temperatures, pump mode and airflow configuration).
Gas conversion

Your Isofast boiler is factory-set to operate with G20 gas.

For operation with G31 gas, some adjustments must be made on the gas valve after removal of the sealed front cover in order to obtain the CO2 values given in the adjacent table.

1/ Maximum hot water input setting, through the CO2:

a - Connect a CO2 analyser to point B of the adapter or flue elbow.

b - Fully open a hot water tap.

c - Wait for 2 minutes or so, until the CO2 reading has stabilized.

d - Adjust the screw C to obtain the G31 CO2 value stated in the table, taking the following principle into account:

**To increase the CO2 value**, turn the screw anti-clockwise

**To decrease the CO2 value**, turn the screw clockwise

4/ After setting and reassembly, restore the maximum heating power to its initial value (20 kW) and stick the gas data tag close to the nameplate.

### Isofast F 35 E

<table>
<thead>
<tr>
<th></th>
<th>G20</th>
<th>G31</th>

</tr>
<tr>
<td>C02 case on</td>
<td>9.2±0.3</td>
<td>10.5±0.3</td>
</tr>
</tbody>
</table>

### 2/ Minimum HEATING input setting, through the CO2:

a - Connect a CO2 analyser to sample point B of the adapter or flue elbow.

b - Adjust the boiler at its minimum heating power using the room thermostat menus described in the below.

c - Perform a heating demand and record the CO2 value after stabilization (2 minutes or so).

d - Adjust the screw D to obtain the G31 CO2 value stated in the table, taking the following principle into account:

**To increase the CO2 value**, turn the screw clockwise

**To decrease the CO2 value**, turn the screw anti-clockwise

Note: After re-installation of the sealed front face, the CO2 value changes, and must correspond to that given in the table.

### 1/ Access to the installer menu

- Connect A connector on the room thermostat as indicated page 44.

- Press **MENU** for 5 seconds to call up the following menu:

  Installer menu

  AfterSales menu

  Fault History

  Boiler Data

  Installer menu

  Access Code

  OK

- Select the Installer menu:

  Installer menu ➔ OK ➔ Access Code ➔ OK ➔ Choose Language

### 2/ Access to boiler configuration

- Set MAX OUTPUT on the minimal value:

  MAX OUTPUT ➔ OK ➔ MAX OUTPUT ➔ OK

WHEN YOU HAVE COMPLETED PARAMETERING, press **MENU** for approx. 5 seconds to return to the initial display.
**Important Notes**

To ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the particular installation and usage, but in general once a year should be enough.

It is the Law that any servicing is carried out by a competent person.

When replacing a part on this appliance, use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by Saunier Duval.

**General**

Measurement of the products of combustion can be achieved by connection of a probe to the combustion analyser test point, see diagram 1.

**IMPORTANT NOTE :**

Products of combustion will be discharged when the cap is removed. It is important to replace the cap immediately. Before commencing with a service or replacement of parts, the boiler should be isolated from the electrical supply and the gas supply should be turned off at the gas isolation valve, see page 35.

All routine servicing requirements can be achieved by the removal of the front panel and inner panel only. To remove simply undo the two screws on the underside of the front panel and lift off. Undo the two screws on the front of inner panel and lift off, see diag. 2. Unless stated otherwise any part removed during servicing should be replaced in the reverse order to removal.

Servicing should always include the removal of any debris from the condensate pipe and siphon.

After completing any servicing of gas carrying components, ALWAYS test for gas soundness and carry out a functional test of the controls.

**Spark Electrode**

Disconnect the electrode lead and two securing screws. Withdraw the spark electrode carefully from the combustion chamber, see diagram 3.

Inspect the tips for damage. Clean away any debris and check the spark gap is 3.5 to 4.5 mm.

**Burner**

Drop down the control panel into the service position.

Disconnect the gas supply at the gas service cock. Remove the two gas pipe retaining clips, one located below gas valve and the other one located on the underside of the boiler chassis.

Pull sealing grommet down gas pipe diagram 4.

Push the gas pipe upwards further into gas valve connection and then rotate anti-clockwise (looking down) until the gas pipe end is over the large hole in boiler chassis. Withdraw the gas pipe from gas valve connection and remove.

Note : When replacing ensure that the sealing grommet, situated below the gas valve is correctly re-seated.

Disconnect the gas valve electrical plug at the gas valve.

Disconnect the electrical leads from the fan.

Remove the five combustion chamber front retaining nuts, see diag. 5.

Gently remove the fan, gas valve and burner assembly from the combustion chamber; see diag. 5.

Clean the burner with a soft brush taking great care not to damage the front insulation. DO NOT use wire or sharp instruments to clean the holes of the burner.

Inspect the burner for any signs of damage.

Inspect the sealing rings and replace if necessary.

Removal of the burner is not necessary during a normal service.

NOTE : IF THE BURNER HAS TO BE REMOVED IT WILL REQUIRE A NEW GASKET WHEN REFITTED.
Draining of Boiler Heating Circuit
 Drain down the Heating Circuit of the boiler only, by closing the heating flow and return isolating taps (t, u, and w) on the boiler connections, see diag. 10.  Attach a length of hose to the drain point and open the drain valve (r), see diag. 9.  After servicing or replacing parts, close the drain valve and remove the hose.  Open the heating flow and return isolating valves and refill, vent and pressurise the heating circuit.  Check for leaks.

Draining of Boiler Hot Water Circuit
 Drain the Domestic Hot Water circuit by closing the cold-water isolation tap (v) on the boiler connection.  Open one or more hot water taps to drain the hot water circuit.  After servicing or replacing parts open the cold-water isolation valve and slowly open a hot water tap to remove air.  Close the hot water tap and check for any leaks.

Inner Casing Panel Seal Check.
 Check the condition of the seal, replace as required.  To replace remove the old seal, thoroughly clean the casing surfaces.  Fit the new seal, it is supplied to the correct length.

Combustion Chamber and Heat Exchanger
 Remove loose debris from combustion chamber using a soft brush and vacuum cleaner.  Carefully flush by spraying water removing any remaining debris through the condensate trap.  Ensure the water is kept away from electrical components.

Condensate Drain
 The condensate drain does not normally need removing during servicing.  To flush the condensate drain carefully pour water into the heat exchanger and check that water flows freely to drain.

Combustion Check.
 If a gas carrying component has been replaced, the combustion of the appliance should be checked.  Once the appliance has been re-assembled (apart from the front and inner casing panels) connect a CO2 combustion analyser to the test point on the flue adapter and follow indications given on page 52-53.

Domestic Cold Water Inlet Filter
 If the water flow rate through the appliance has reduced it may be necessary to clean or

Central Heating Return Filter
 Turn off the electrical supply to the boiler.  Drain the heating circuit of the boiler.  Remove the filter retaining clip under the pump see diag. 7, and filter clean or renew if necessary.  Refit the filter.  Open the heating flow and return isolating valves and refill, vent and pressurise the heating circuit.  Check for leaks.
The after-sales menus, accessible from the room thermostat, allow investigating possible malfunctions and modifying certain factory set values.

Accessing the Aftersales menu

1. Connect boiler connector (A) to the room thermostat as described on page 44:
   - Connect boiler connector (A) to the room thermostat as described on page 44.
   - DO NOT connect the boiler connector to the room thermostat.

2. Use the buttons to select the "Fault history" menu:
   - Use the buttons to select the "Fault history" menu.
   - The display shows the fault number and its date of occurrence.

3. Use the buttons to select the "Boiler data" menu:
   - Use the buttons to select the "Boiler data" menu.
   - Every validation through the OK key will cause display of the corresponding value during boiler operation.

WHEN YOU HAVE COMPLETED PARAMETERS, press for approx. 5 seconds to return to the initial display.

Communication test

- **DO NOT** connect the boiler connector to the room thermostat.
- Press for 5 seconds to call up the following menu:
  - Press for 5 seconds to call up the following menu:

The room thermostat then transmits signals every 10 s. Successive display of the numbers means that the signals are properly routed.
NOTE
Before trying to operate the boiler make sure that:
• All gas supply cocks are open and that the gas supply has been purged of air.
• There is a permanent mains supply to the boiler.
• There is a heating demand from the external control.

WARNING.
Always isolate the boiler from the electrical supply before carrying out any electrical replacement work.

Fault finding

Always check for gas soundness after any service work.

Electrical Testing
Should there be any doubt about the voltage supply to any of the components, it is possible to carry out a simple electrical test.

Important.
On completion of the Service/Fault Finding tasks which have required the breaking and remaking of the electrical connections the earth continuity, polarity, short circuit and resistance to earth checks must be repeated using a suitable multimeter.

To carry out the electrical test, gain access, as follows:
Hinge down the control box and remove Torx screws and unhook the rear panel, refer diagram 2 page 54. Refer to the Wiring diagram and fault finding charts diagrams.
Fault finding

Possible Cause

F1 Ignition fault (Blinking/Boiler failed to light)
No gas
Inefficient gas
Incorrect gas valve adjustment
Electrode ignition lead detect
Electronic igniter defective
Check air in inlet duct
Check connections to igniter unit

F4 Ignition fault (Blinking) Went out when lit
As F1 possible cause

F5 Overheat fault
Overheat stat operated
Maximum temperature exceeded
Check thermistor connections
Air in system with thermistor at maximum setting
Faulty overheat stat connection

F6 Central heating flow thermistor fault
Thermistor cable defective/broken, thermistor faulty
Check that thermistor attached correctly to pipe

F7 Domestic Hot Water thermistor fault
Thermistor cable defective/broken, thermistor faulty
Check that thermistor attached correctly to pipe

F8 Water pressure sensor fault
Faulty sensor connection
Check wiring

F10 Central heating return thermistor fault
Thermistor cable defective/broken, thermistor faulty
Check that thermistor attached correctly to pipe

F11 Main board connection fault
Check wiring between mainboard and user interface

F12 User Interface connection fault
Check wiring between mainboard and user interface

F13 Main PCB connection fault
Check connections and wires

F14 Central heating flow temperature is greater than 95°C
System fault
Possible pump failure
Check thermistor on flow

F16 Flame detection fault (Flame presence for more than 5 seconds after burner started)
Gas valve defective
Check electrical supply / polarity

F17 Power supply is less than 110V
Check electrical supply / polarity

F18 User interface fault
Faulty User Interface

F19 Central heating thermistor unplugged
Check thermistor connection

F20 Software incompatibility
Incorrect user Interface or Main PCB

F24 Central heating return temperature is greater than 90°C
System fault
Possible pump failure
Check thermistor on return

F25 Maximum temperature rise slope
Possible pump failure
Air in system

F26 Maximum delta temperature
Check thermistor on return
System - too restrictive
Replacement of parts

**General**
Replacement of parts must be carried out by a competent person. Before replacing any parts the boiler should be isolated from the mains electric supply and the gas should be turned off at the service cock on the boiler. Unless stated otherwise parts are replaced in the reverse order to removal. After replacing any parts always test for gas soundness and if necessary carry out functional test of the controls.

For replacement of parts the front casing and the inner casing panel of the boiler will need to be removed. To remove undo the two screws on the underside of the front casing and lift off. Undo the two screws on the front of the inner front panel and lift off. The side panels can be hinged sideways to aid replacement of parts. To hinge a side panel undo and remove the three screws securing each side panel to the boiler, two at the front and one at the top.

**Spark Electrode**
For access, refer to section “General”. Remove the spark plug lead, earth lead and two securing screws. Withdraw the spark electrode carefully from the combustion chamber, see diagram 3 page 55.

**Igniter Unit**
For access, refer to section “General”. Remove ignition lead and electrical connections then remove igniter unit by removing two securing screws, see diagram 1.

**Ignition Lead**
For access, refer to section “General”. Pull the spark plug style connector off the spark electrode and the spade connector connected to the igniter unit, see diagram 1.

**Gas Valve**
For access, refer to section “General”. Remove the electrical plug from the gas valve, see diagram 2. Refer to pages 54 and 55 for removal of the fan, gas valve and burner assembly. Before removing the gas valve note its position on the fan. Remove the three securing screws, which fix the gas valve and plastic swirl plate to the venturi on the fan, see diagram 3. Remove the gas valve.

When re-fitting the gas valve take care as it can be fitted more than one way. After re-fitting check the combustion CO2 and adjust if necessary, see page 52-53. After assembly test for gas soundness and purge in accordance with the current issue of BS6891 or in IE, the current edition of IS.813 “Domestic Gas Installations”.

**Fan**
For access, refer to section “General”. Refer to pages 54 and 55 for removal of the fan, gas valve and burner assembly. Remove the gas valve. Remove the venturi plate secured with three screws, see diagram 3. Remove the two screws securing the fan to the gas manifold, see diagram 4, check the gasket and replace if necessary.

**Burner**
For access, refer to section “General”. Refer to pages 54 and 55 for removal of the fan, gas valve and burner assembly. Remove the four screws that secure the burner, see diagram 5. NOTE: THE BURNER WILL REQUIRE A NEW GASKET WHEN REFITTED.

**Front Insulation**
For access, refer to section “General”. Refer to pages 56 and 57 for removal of the fan, gas valve and burner assembly. Remove burner as previous section. Remove spark electrode. NOTE: THE BURNER WILL REQUIRE A NEW GASKET WHEN REFITTED.

**Rear Insulation**
For access, refer to section “General”. Refer to pages 54 and 55 for removal of the fan, gas valve and burner assembly. Remove securing screw and washer in the centre of the insulation and withdraw insulation, see diagram 6.

**Viewing Window**
For access, refer to section “General”. Refer to diagram 7. Remove circlip. Remove steel washer. Remove glass. Remove fibre washer. Replace in reverse order.
Replacement of parts

**Expansion Vessel**
For access, refer to section “General”.
Refer to page 57 and drain the boiler heating circuit.
Undo the coupling at the base of the vessel, see diagram 8.
While holding the vessel remove the securing bolt on the top panel of the boiler.
Remove upper support bracket.
Lift the vessel up, draw bottom out to the left, lower and remove.
Fit the replacement unit.
Fit a new gasket between the expansion vessel and coupling.
Refill, vent and pressurise the boiler.
Check for leaks.

**Heat Exchanger**
For access, refer to section “General”.
Refer to pages 54 and 55 for removal of the fan, gas valve and burner assembly.
Drain the boiler heating circuit, and the hot water circuit see page 57.
Remove the clip securing the clear condense pipe to heat exchanger.
Pull to remove the clear condense pipe out of the bottom of the heat exchanger.
Undo the two nuts of the flow and return pipes from the heat exchanger.
Move the pipes away from the heat exchanger.
Loosen the three heat exchanger securing screws and clamps (two at the top and one at the bottom) to remove the heat exchanger, see diagram 9.
CAUTION: There will be water in the heat exchanger.
Remove condense pipe connector from bottom of heat exchanger.
Carefully ease heat exchanger out.

**Flue Hood**
For access, refer to section “General”.
Remove heat exchanger as per previous section.
Remove the two securing screws and pull the flue hood down and away from the flue hood bracket and flue elbow, see diagram 10.

**Diverter Valve Motor**
For access, refer to section “General”.
Refer to diagram 11.
Remove the electrical plug.
Unscrew the retaining nut.
Remove the diverter valve motor.

**Pump (head only)**
For access, refer to section “General”.
Drain the boiler heating circuit.
Refer to diagram 12.
Remove the four cap head screws.
Carefully remove the pump head together with cable.
Do not strain cable.
Support the pump head, unscrew cable cover at the side of pump head and take off.
Disconnect wiring from pump head.
Reconnect wiring to new pump head and fit cover.
Fit the new pump head with ‘O’ ring.
Refill, vent and pressurise the boiler.
Check for leaks.

**Safety Discharge Valve**
For access, refer to section “General”.
Drain the boiler heating circuit.
Refer to diagram 13.
Undo the safety discharge valve union and remove from the pipework.
Remove the securing clip and withdraw the safety discharge valve.
Fit new ‘O’ ring.
Refill, vent and pressurise the boiler.
Check for leaks.

**Domestic Hot Water Thermistor**
For access, refer to section “General”.
Drain the boiler domestic hot water circuit.
Refer to diagram 14.
Disconnect the domestic hot water thermistor electrical connections.
Remove retaining clip.
Withdraw domestic hot water thermistor from its housing.
Note: When reconnecting electrical connections, polarity is not important.
Fit new ‘O’ ring.
Carry out a functional test of the controls.

**Heating Flow Thermistor**
For access, refer to section “General”.
Refer to diagram 15.
Remove the electrical connections from the thermistor.
Remove the retaining clip from the flow pipe.
Note: When reconnecting the polarity of the wiring to thermistors is unimportant.
Replacement of parts

Heating Return Thermistor
For access, refer to section “General”. Refer to diagram 15. Remove the electrical connections from the thermistor. Remove the retaining clip from the flow pipe. Note: When reconnecting the polarity of the wiring to thermistors is unimportant.

Overheat Thermostat
For access, refer to section “General”. Refer to diagram 15. Remove the electrical connections from the overheat thermostat. Remove the retaining clip from the flow pipe. Remove the overheat thermostat from the retaining clip. NOTE: When fitting new thermostat, please ensure that it is located correctly onto the flat area of the pipe and the retaining clip is secure.

Automatic Air Vent
For access, refer to section “General”. Drain the boiler heating circuit. Refer to diagram 16. Remove the retaining clip and remove the automatic air vent. Fit the new automatic air vent and ‘O’ ring ensuring the vent cap is left loose. Refill, vent and pressurise the boiler. Check for leaks.

Flow Sensor
For access, refer to section “General”. Drain down the hot water circuit.
• Undo the union nut on the cold water inlet isolating valve.
• Pull out slotted metal clip securing filling system tap into housing, swing the tap forwards.
• Pull out the two slotted metal clips retaining the domestic water inlet filter housing.
• Remove electrical connections from water flow sensor.
• Pull off slotted metal clip and remove water flow sensor.

Low Water Pressure Sensor
For access, refer to section “General”. Drain the boiler heating circuit. Refer to diagram 18. Disconnect the electrical lead by pushing up retaining tab to withdraw the lead plug. Remove the retaining clip to remove the low water pressure sensor.
Fit new ‘O’ rings.
Fit the new low water pressure sensor. Refill vent and pressurise the boiler. Check for leaks.

Bypass Valve
For access, refer to section “General”. Drain the boiler heating circuit. Refer to diagram 19. Remove the retaining clip to remove the bypass valve.
Fit new ‘O’ rings.
Replace the bypass valve, refill, vent and pressurise the boiler. Adjust the bypass as described pages 22-23. Check for leaks.

Filling Loop Valve
For access, refer to section “General”. Drain the boiler hot water circuit. Refer to diagram 20. Remove the clip securing the filling loop valve to the domestic water filter housing. Disengage by pulling forward. Remove the clip securing the filling loop to the filling loop valve. Remove the filling loop valve from the filling loop. Fit new ‘O’ rings. After replacing the filling loop valve open the cold water isolation valve and slowly open a hot water tap to remove air. Close the hot water tap and check for any leaks.

Filling Loop Tube
For access, refer to section “General”. Drain the boiler hot water circuit. Refer to diagram 20. Remove the retaining clips to remove the filling loop tube. Fit new ‘O’ rings. After replacing the filling loop tube open the cold water isolation valve and slowly open a hot water tap to remove air. Close the hot water tap and check for any leaks.
Indianapolis, Indiana 46222

INSTALLERS

Replacement of parts

Reduced Pressure Zone Valve
For access, refer to section "General".
Refer to diagram 20.
Drain the boiler hot water circuit.
Remove the filling loop
Remove the retaining clip to remove the reduced pressure zone valve.
Fit new ‘O’ rings.
Replace the reduced pressure zone valve, refill, vent and pressurise the boiler.
Check for leaks.

Domestic Cold Water Inlet Filter
For access, refer to section "General".
Refer to page 56.
Fit new ‘O’ rings.

Central Heating Filter
Refer to section page 56.
Fit new ‘O’ rings.

Heating Circuit Drain Point
Refer to page 57 to drain the boiler heating circuit.
Refer to diagram 21.
Remove the retaining clip to remove the drain point.
Fit new ‘O’ rings.
Replace the drain point, refill, vent and pressurise the boiler.
Check for leaks.

Inner Casing Panel Seal
For access, refer to section "General".
Remove the inner casing panel.
To replace remove the old seal, thoroughly clean the casing surfaces. Fit the new seal, it is supplied to the correct length.
Refit the inner casing panel.
NOTE: Ensure the seal is fitted correctly giving an airtight joint.

Condense Drain
For access, refer to section "General".
Refer to diagram 22.
Remove the clips securing the flexible tubes to the siphon adapter by twisting the clips slightly to disengage the clip jaws from each other.
Remove black flexible tubes from siphon adapter.
Lift off the siphon adapter.
Remove the drain connection downstream of the condense trap.
Remove the two condense trap securing screws. Lift up and carefully remove the condense trap taking care not to spill any water which may be left in the unit. As the unit is lifted remove the flexible pipe on the outlet. Remove the cap at the base of the condense trap.
Remove any solids found.

---

Plate-to-Plate Heat Exchanger
For access, refer to section "General".
Drain the boiler heating and hot water circuits.
Remove the water flow sensor, refer to previous section.
Unclip the central heating thermistor.
Unscrew the heating flow pipe union nut, swing pipe forwards.
Remove the system water pressure sensor.
Supporting domestic hot water plate to plate heat exchanger, unscrew and remove two screws securing it onto pump mounting and 3-way valve/bypass housing.
Remove plate to plate heat exchanger from boiler.
Fit replacement plate to plate heat exchanger in reverse order to removal using new seals, supplied.
NOTE: Plate to plate heat exchanger mounting screws are offset to ensure correct fitting.

Domestic safety valve (10 bar BLUE), refer to diagram 24.
For access, refer to section "General".
Drain down the hot water circuit only.
Undo discharge pipe union nut.
Pull out slotted metal clip from valve body and remove valve.

Micro accumulator vessel
Thermistor, refer to diagram 25.
For access, refer to section "General".
This operation the boiler must be removed from the wall.
IMPORTANT: With regards to the manual handling operations, 1992 regulations, the following operation exceeds the recommended weight for one man lift.
When ordering spare parts, quote the part number and description, stating the appliance model number and serial number from the data badge.

**Short parts list**
